

# Package ‘CGGP’

May 7, 2026

**Type** Package

**Title** Composite Grid Gaussian Processes

**Version** 1.0.4

**Description** Run computer experiments using the adaptive composite grid algorithm with a Gaussian process model.  
The algorithm works best when running an experiment that can evaluate thousands of points from a deterministic computer simulation.  
This package is an implementation of a forthcoming paper by Plumlee, Erickson, Ankenman, et al. For a preprint of the paper, contact the maintainer of this package.

**License** GPL-3

**Imports** Rcpp (>= 0.12.18)

**LinkingTo** Rcpp, RcppArmadillo

**Suggests** testthat, covr, ggplot2, reshape2, plyr, MASS, rmarkdown, knitr

**URL** <https://github.com/CollinErickson/CGGP>

**BugReports** <https://github.com/CollinErickson/CGGP/issues>

**Encoding** UTF-8

**RoxygenNote** 7.2.3

**VignetteBuilder** knitr

**NeedsCompilation** yes

**Author** Collin Erickson [aut, cre],  
Matthew Plumlee [aut]

**Maintainer** Collin Erickson <collinberickson@gmail.com>

**Repository** CRAN

**Date/Publication** 2024-01-23 03:22:57 UTC

---

 CGGP

*CGGP: A package for running sparse grid computer experiments*

---

**Description**

The CGGP package implements the method presented in Plumlee et al. (2019).

**CGGP functions**

The CGGP functions: `CGGPcreate`, `CGGPfit`, `CGGPappend`, and `CGGPpred`

---

 CGGPappend

*Add points to CGGP*

---

**Description**

Add ‘batchsize’ points to ‘SG’ using ‘theta’.

**Usage**

```
CGGPappend(CGGP, batchsize, selectionmethod = "MAP")
```

**Arguments**

CGGP            Sparse grid object

batchsize      Number of points to add

selectionmethod

How points will be selected: one of ‘UCB’, ‘TS’, ‘MAP’, ‘Oldest’, ‘Random’, or ‘Lowest’. ‘UCB’ uses Upper Confidence Bound estimates for the parameters. ‘TS’ uses Thompson sampling, a random sample from the posterior. ‘MAP’ uses maximum a posteriori parameter estimates. ‘Oldest’ adds the block that has been available the longest. ‘Random’ adds a random block. ‘Lowest’ adds the block with the lowest sum of index levels. ‘UCB’ and ‘TS’ are based on bandit algorithms and account for uncertainty in the parameter estimates, but are the slowest. ‘MAP’ is fast but doesn’t account for parameter uncertainty. The other three are naive methods that are not adaptive and won’t perform well.

**Value**

SG with new points added.

**See Also**

Other CGGP core functions: [CGGPcreate\(\)](#), [CGGPfit\(\)](#), [predict.CGGP\(\)](#)

**Examples**

```

SG <- CGGPcreate(d=3, batchsize=100)
y <- apply(SG$design, 1, function(x){x[1]+x[2]^2})
SG <- CGGPfit(SG, Y=y)
SG <- CGGPappend(CGGP=SG, batchsize=20, selectionmethod="MAP")

```

---

CGGPcreate	<i>Create sparse grid GP</i>
------------	------------------------------

---

**Description**

Create sparse grid GP

**Usage**

```

CGGPcreate(
  d,
  batchsize,
  corr = "PowerExponential",
  grid_sizes = c(1, 2, 4, 4, 8, 12, 20, 28, 32),
  Xs = NULL,
  Ys = NULL,
  HandlingSuppData = "Correct",
  supp_args = list()
)

```

**Arguments**

d	Input dimension
batchsize	Number added to design each batch for now only on predictions
corr	Name of correlation function to use. Must be one of "CauchySQT", "CauchySQ", "Cauchy", "Gaussian", "PowerExp", "Matern32", "Matern52".
grid_sizes	Size of grid refinements.
Xs	Supplemental X data
Ys	Supplemental Y data
HandlingSuppData	How should supplementary data be handled? * Correct: full likelihood with grid and supplemental data * Only: only use supplemental data * Ignore: ignore supplemental data
supp_args	Arguments used to fit if Xs and Ys are given

**Value**

CGGP

**See Also**

Other CGGP core functions: [CGGPappend\(\)](#), [CGGPfit\(\)](#), [predict.CGGP\(\)](#)

**Examples**

```
CGGPcreate(d=8,200)
```

---

CGGPfit

*Update CGGP model given data*

---

**Description**

This function will update the GP parameters for a CGGP design.

**Usage**

```
CGGPfit(
  CGGP,
  Y,
  Xs = NULL,
  Ys = NULL,
  theta0 = pmax(pmin(CGGP$thetaMAP, 0.8), -0.8),
  HandlingSuppData = CGGP$HandlingSuppData,
  separateoutputparameterdimensions = is.matrix(CGGP$thetaMAP),
  set_thetaMAP_to,
  corr,
  Ynew
)
```

**Arguments**

CGGP	Sparse grid objects
Y	Output values calculated at CGGP\$design
Xs	Supplemental X matrix
Ys	Supplemental Y values
theta0	Initial theta
HandlingSuppData	How should supplementary data be handled? * Correct: full likelihood with grid and supplemental data * Only: only use supplemental data * Ignore: ignore supplemental data
separateoutputparameterdimensions	If multiple output dimensions, should separate parameters be fit to each dimension?
set_thetaMAP_to	Value for thetaMAP to be set to
corr	Will update correlation function, if left missing it will be same as last time.
Ynew	Values of 'CGGP\$design_unevaluated'

**Value**

Updated CGGP object fit to data given

**See Also**

Other CGGP core functions: [CGGPappend\(\)](#), [CGGPcreate\(\)](#), [predict.CGGP\(\)](#)

**Examples**

```
cg <- CGGPcreate(d=3, batchsize=100)
y <- apply(cg$design, 1, function(x){x[1]+x[2]^2})
cg <- CGGPfit(CGGP=cg, Y=y)
```

---

CGGPplotblocks

*CGGP block plot*

---

**Description**

Plot the 2D projections of the blocks of an CGGP object.

**Usage**

```
CGGPplotblocks(CGGP, singleplot = TRUE)
```

**Arguments**

CGGP	CGGP object
singleplot	If only two dimensions, should a single plot be made?

**Value**

ggplot2 plot

**See Also**

Other CGGP plot functions: [CGGPplotcorr\(\)](#), [CGGPplotheat\(\)](#), [CGGPplothist\(\)](#), [CGGPplotsamplesneglogpost\(\)](#), [CGGPplotslice\(\)](#), [CGGPplottheta\(\)](#), [CGGPplotvariogram\(\)](#), [CGGPvalplot\(\)](#)

**Examples**

```
# The first and fourth dimensions are most active and will have greater depth
ss <- CGGPcreate(d=5, batchsize=50)
f <- function(x) {cos(2*pi*x[1]*3) + x[3]*exp(4*x[4])}
ss <- CGGPfit(ss, Y=apply(ss$design, 1, f))
ss <- CGGPappend(CGGP=ss, batchsize=100)
CGGPplotblocks(ss)

mat <- matrix(c(1,1,1,2,2,1,2,2,1,3), ncol=2, byrow=TRUE)
CGGPplotblocks(mat)
```

---

`CGGPplotblockselection`*Plot CGGP block selection over time*

---

**Description**

Shows the order in which blocks were selected for each dimension. Gives an idea of how the selections change over time.

**Usage**

```
CGGPplotblockselection(CGGP, indims)
```

**Arguments**

<code>CGGP</code>	CGGP object
<code>indims</code>	Which input dimensions should be shown?

**Value**

ggplot2 object

**Examples**

```
gs <- CGGPcreate(d=3, batchsize=100)
# All dimensions will look similar
CGGPplotblockselection(gs)

# You need to append with CGGPappend after fitting to see a difference
f <- function(x){x[1]^1.2}
y <- apply(gs$design, 1, f)
gs <- CGGPfit(gs, Y=y)
gs <- CGGPappend(gs, 100)
# Now you will see higher for X1 from 100 to 200 while others remain low.
CGGPplotblockselection(gs)
```

---

`CGGPplotcorr`*Plot correlation samples*

---

**Description**

Plot samples for a given correlation function and parameters. Useful for getting an idea of what the correlation parameters mean in terms of smoothness.

**Usage**

```
CGGPplotcorr(
  Corr = CGGP_internal_CorrMatGaussian,
  theta = NULL,
  numlines = 20,
  outdims = NULL,
  zero = TRUE
)
```

**Arguments**

Corr	Correlation function or CGGP object. If CGGP object, it will make plots for thetaMAP, the max a posteriori theta.
theta	Parameters for Corr
numlines	Number of sample paths to draw
outdims	Which output dimensions should be used?
zero	Should the sample paths start at y=0?

**Value**

Plot

**See Also**

Other CGGP plot functions: [CGGPplotblocks\(\)](#), [CGGPplothet\(\)](#), [CGGPplohist\(\)](#), [CGGPplotsamplesneglogpost\(\)](#), [CGGPplotslice\(\)](#), [CGGPplottheta\(\)](#), [CGGPplotvariogram\(\)](#), [CGGPvalplot\(\)](#)

**Examples**

```
CGGPplotcorr()
CGGPplotcorr(theta=c(-2,-1,0,1))

SG <- CGGPcreate(d=3, batchsize=100)
f <- function(x){x[1]^1.2+sin(2*pi*x[2]*3)}
y <- apply(SG$design, 1, f)
SG <- CGGPfit(SG, Y=y)
CGGPplotcorr(SG)
```

---

CGGPplothet

*Heatmap of SG design depth*

---

**Description**

The values on the diagonal are largest design depth for that dimension. The off-diagonal values are the largest design depth that both dimensions have been measured at simultaneously. A greater depth means that more points have been measured along that dimension or two-dimensional sub-space.

**Usage**

```
CGGPplotheat(CGGP)
```

**Arguments**

```
CGGP          CGGP object
```

**Value**

A heat map made from ggplot2

**References**

<https://stackoverflow.com/questions/14290364/heatmap-with-values-ggplot2>

**See Also**

Other CGGP plot functions: [CGGPplotblocks\(\)](#), [CGGPplotcorr\(\)](#), [CGGPplothist\(\)](#), [CGGPplotsamplesneglogpost\(\)](#), [CGGPplotslice\(\)](#), [CGGPplottheta\(\)](#), [CGGPplotvariogram\(\)](#), [CGGPvalplot\(\)](#)

**Examples**

```
# All dimensions should look similar
d <- 8
SG = CGGPcreate(d,201)
CGGPplotheat(SG)

# The first and fourth dimensions are most active and will have greater depth
SG <- CGGPcreate(d=5, batchsize=50)
f <- function(x) {cos(2*pi*x[1]*3) + exp(4*x[4])}
for (i in 1:1) {
  SG <- CGGPfit(SG, Y=apply(SG$design, 1, f))
  SG <- CGGPappend(CGGP=SG, batchsize=200)
}
# SG <- CGGPfit(SG, Y=apply(SG$design, 1, f))
CGGPplotheat(SG)
```

---

CGGPplothist

*Histogram of measurements at each design depth of each input dimension*

---

**Description**

A greater design depth signifies a more important dimension. Thus a larger right tail on the histogram are more important variables.

**Usage**

```
CGGPplothist(CGGP, ylog = TRUE)
```

**Arguments**

CGGP	CGGP object
ylog	Should the y axis be put on a log scale?

**Value**

Histogram plot made using ggplot2

**See Also**

Other CGGP plot functions: [CGGPplotblocks\(\)](#), [CGGPplotcorr\(\)](#), [CGGPplotheat\(\)](#), [CGGPplotsamplesneglogpost\(\)](#), [CGGPplotslice\(\)](#), [CGGPplottheta\(\)](#), [CGGPplotvariogram\(\)](#), [CGGPvalplot\(\)](#)

**Examples**

```
# All dimensions should look similar
d <- 8
SG = CGGPcreate(d,201)
CGGPplothist(SG)
CGGPplothist(SG, ylog=FALSE)

# The first dimension is more active and will have greater depth
f <- function(x) {sin(x[1]^0.6*5)}
SG <- CGGPcreate(d=5, batchsize=100)
SG <- CGGPfit(SG, apply(SG$design, 1, f))
SG <- CGGPappend(CGGP=SG, batchsize=1000)
CGGPplothist(SG)
```

---

CGGPplotsamplesneglogpost

*Plot negative log posterior likelihood of samples*

---

**Description**

Plot negative log posterior likelihood of samples

**Usage**

```
CGGPplotsamplesneglogpost(CGGP)
```

**Arguments**

CGGP	CGGP object
------	-------------

**Value**

ggplot2 object

**See Also**

Other CGGP plot functions: [CGGPplotblocks\(\)](#), [CGGPplotcorr\(\)](#), [CGGPplotheat\(\)](#), [CGGPplohist\(\)](#), [CGGPplotslice\(\)](#), [CGGPplottheta\(\)](#), [CGGPplotvariogram\(\)](#), [CGGPvalplot\(\)](#)

**Examples**

```
gs <- CGGPcreate(d=3, batchsize=100)
f <- function(x){x[1]^1.2+x[3]^.4*sin(2*pi*x[2]^2*3) + .1*exp(3*x[3])}
y <- apply(gs$design, 1, f)
gs <- CGGPfit(gs, Y=y)
CGGPplotsamplesneglogpost(gs)
```

---

CGGPplotslice

*CGGP slice plot*

---

**Description**

Show prediction plots when varying over only one dimension. Most useful when setting all values to 0.5 because it will have the most points.

**Usage**

```
CGGPplotslice(
  CGGP,
  proj = 0.5,
  np = 300,
  color = "pink",
  outdims,
  scales = "free_y",
  facet = "grid"
)
```

**Arguments**

CGGP	CGGP object
proj	Point to project onto
np	Number of points to use along each dimension
color	Color to make error region
outdims	If multiple outputs, which of them should be plotted?
scales	Parameter passed to <code>ggplot2::facet_grid()</code>
facet	If "grid", will use <code>ggplot2::facet_grid()</code> , if "wrap" will use <code>ggplot2::facet_wrap()</code> . Only applicable for a single output dimension.

**Value**

ggplot2 object

**See Also**

Other CGGP plot functions: [CGGPplotblocks\(\)](#), [CGGPplotcorr\(\)](#), [CGGPplotheat\(\)](#), [CGGPplothist\(\)](#), [CGGPplotsamplesneglogpost\(\)](#), [CGGPplottheta\(\)](#), [CGGPplotvariogram\(\)](#), [CGGPvalplot\(\)](#)

**Examples**

```
d <- 5
f1 <- function(x){x[1]+x[2]^2 + cos(x[3]^2*2*pi*4) - 3.3}
s1 <- CGGPcreate(d, 200)
s1 <- CGGPfit(s1, apply(s1$design, 1, f1))
#s1 <- CGGPappend(s1, 200)
#s1 <- CGGPfit(s1, apply(s1$design, 1, f1))
CGGPplotslice(s1)
CGGPplotslice(s1, 0.)
CGGPplotslice(s1, s1$design[nrow(s1$design),])
```

---

CGGPplottheta

*Plot theta samples*

---

**Description**

Plot theta samples

**Usage**

```
CGGPplottheta(CGGP)
```

**Arguments**

CGGP                    CGGP object

**Value**

ggplot2 object

**See Also**

Other CGGP plot functions: [CGGPplotblocks\(\)](#), [CGGPplotcorr\(\)](#), [CGGPplotheat\(\)](#), [CGGPplothist\(\)](#), [CGGPplotsamplesneglogpost\(\)](#), [CGGPplotslice\(\)](#), [CGGPplotvariogram\(\)](#), [CGGPvalplot\(\)](#)

**Examples**

```
gs <- CGGPcreate(d=3, batchsize=100)
f <- function(x){x[1]^1.2+x[3]^0.4*sin(2*pi*x[2]^2*3) + .1*exp(3*x[3])}
y <- apply(gs$design, 1, f)
gs <- CGGPfit(gs, Y=y)
CGGPplottheta(gs)
```

---

CGGPplotvariogram      *Plot something similar to a semivariogram*

---

**Description**

It's not actually a variogram or semivariogram. It shows how the correlation function falls off as distance increases.

**Usage**

```
CGGPplotvariogram(CGGP, facet = 1, outdims = NULL)
```

**Arguments**

CGGP	CGGP object
facet	How should the plots be faceted? If 1, in a row, if 2, in a column, if 3, wrapped around.
outdims	Which output dimensions should be shown.

**Value**

ggplot2 object

**See Also**

Other CGGP plot functions: [CGGPplotblocks\(\)](#), [CGGPplotcorr\(\)](#), [CGGPplotheat\(\)](#), [CGGPplothist\(\)](#), [CGGPplotsamplesneglogpost\(\)](#), [CGGPplotslice\(\)](#), [CGGPplottheta\(\)](#), [CGGPvalplot\(\)](#)

**Examples**

```
SG <- CGGPcreate(d=3, batchsize=100)
f <- function(x){x[1]^1.2+x[3]^0.4*sin(2*pi*x[2]^2*3) + .1*exp(3*x[3])}
y <- apply(SG$design, 1, f)
SG <- CGGPfit(SG, Y=y)
CGGPplotvariogram(SG)
```

---

CGGPvalplot      *Plot validation prediction errors for CGGP object*

---

**Description**

Plot validation prediction errors for CGGP object

**Usage**

```
CGGPvalplot(CGGP, Xval, Yval, d = NULL)
```

**Arguments**

CGGP	CGGP object that has been fitted
Xval	X validation data
Yval	Y validation data
d	If output is multivariate, which column to use. Will do all if left as NULL.

**Value**

None, makes a plot

**See Also**

Other CGGP plot functions: [CGGPplotblocks\(\)](#), [CGGPplotcorr\(\)](#), [CGGPplotheat\(\)](#), [CGGPplohist\(\)](#), [CGGPplotsamplesneglogpost\(\)](#), [CGGPplotslice\(\)](#), [CGGPplottheta\(\)](#), [CGGPplotvariogram\(\)](#)

**Examples**

```
SG <- CGGPcreate(d=3, batchsize=100)
f1 <- function(x){x[1]+x[2]^2}
y <- apply(SG$design, 1, f1)
SG <- CGGPfit(SG, y)
Xval <- matrix(runif(3*100), ncol=3)
Yval <- apply(Xval, 1, f1)
CGGPvalplot(CGGP=SG, Xval=Xval, Yval=Yval)
```

---

CGGPvalstats

*Calculate stats for CGGP prediction on validation data*

---

**Description**

Calculate stats for CGGP prediction on validation data

**Usage**

```
CGGPvalstats(CGGP, Xval, Yval, bydim = TRUE, ...)
```

**Arguments**

CGGP	CGGP object
Xval	X validation matrix
Yval	Y validation data
bydim	If multiple outputs, should it be done separately by dimension?
...	Passed to valstats, such as which stats to calculate.

**Value**

data frame

**Examples**

```

SG <- CGGPcreate(d=3, batchsize=100)
f1 <- function(x){x[1]+x[2]^2}
y <- apply(SG$design, 1, f1)
SG <- CGGPfit(SG, y)
Xval <- matrix(runif(3*100), ncol=3)
Yval <- apply(Xval, 1, f1)
CGGPvalstats(CGGP=SG, Xval=Xval, Yval=Yval)

# Multiple outputs
SG <- CGGPcreate(d=3, batchsize=100)
f1 <- function(x){x[1]+x[2]^2}
f2 <- function(x){x[1]^1.3+.4*sin(6*x[2])+10}
y1 <- apply(SG$design, 1, f1)#+rnorm(1,0,.01)
y2 <- apply(SG$design, 1, f2)#+rnorm(1,0,.01)
y <- cbind(y1, y2)
SG <- CGGPfit(SG, Y=y)
Xval <- matrix(runif(3*100), ncol=3)
Yval <- cbind(apply(Xval, 1, f1),
              apply(Xval, 1, f2))
CGGPvalstats(SG, Xval, Yval)
CGGPvalstats(SG, Xval, Yval, bydim=FALSE)

```

---

CGGP\_internal\_calcMSE *Calculate MSE over single dimension*

---

**Description**

Calculated using grid of integration points. Can be calculated exactly, but not much reason in 1D.

**Usage**

```
CGGP_internal_calcMSE(x1, theta, CorrMat)
```

**Arguments**

x1	Vector of points in 1D
theta	Correlation parameters
CorrMat	Function that gives correlation matrix for vectors of 1D points.

**Value**

MSE value

**Examples**

```
CGGP_internal_calcMSE(x1=c(0,.5,.9), theta=c(1,2,3),
                      CorrMat=CGGP_internal_CorrMatCauchySQT)
```

---

 CGGP\_internal\_calcMSEde

*Calculate MSE over blocks*

---

### Description

Delta of adding block is product over  $i=1..d$  of  $IMSE(i,j-1) - IMSE(i,j)$

### Usage

```
CGGP_internal_calcMSEde(valsinds, MSE_MAP)
```

### Arguments

valsinds	Block levels to calculate MSEs for
MSE_MAP	Matrix of MSE values

### Value

All MSE values

### Examples

```
SG <- CGGPcreate(d=3, batchsize=100)
y <- apply(SG$design, 1, function(x){x[1]+x[2]^2})
SG <- CGGPfit(SG, Y=y)
MSE_MAP <- outer(1:SG$d, 1:8,
  Vectorize(function(dimlcv, lcv1) {
    CGGP_internal_calcMSE(SG$xb[1:SG$sizeest[dimlcv]],
      theta=SG$thetaMAP[(dimlcv-1)*SG$numpara+1:SG$numpara],
      CorrMat=SG$CorrMat)
  }))
CGGP_internal_calcMSEde(SG$po[1:SG$poCOUNT, ], MSE_MAP)
```

---

 CGGP\_internal\_calcpw *Calculate predictive weights for CGGP*

---

### Description

Predictive weights are  $\Sigma^{-1}y$  in standard GP. This calculation is much faster since we don't need to solve the full system of equations.

### Usage

```
CGGP_internal_calcpw(CGGP, y, theta, return_ls = FALSE)
```

**Arguments**

CGGP	CGGP object
y	Measured values for CGGP\$design
theta	Correlation parameters
return_1S	Should 1S be returned?

**Value**

Vector with predictive weights

**Examples**

```
cggp <- CGGPcreate(d=3, batchsize=100)
y <- apply(cggp$design, 1, function(x){x[1]+x[2]^2+rnorm(1,0,.01)})
CGGP_internal_calcpw(CGGP=cggp, y=y, theta=cggp$thetaMAP)
```

---

CGGP\_internal\_calcpwanddpw

*Calculate derivative of pw*

---

**Description**

Calculate derivative of pw

**Usage**

```
CGGP_internal_calcpwanddpw(CGGP, y, theta, return_1S = FALSE)
```

**Arguments**

CGGP	CGGP object
y	Measured values for CGGP\$design
theta	Correlation parameters
return_1S	Should 1S and d1S be returned?

**Value**

derivative matrix of pw with respect to logtheta

**Examples**

```
cggp <- CGGPcreate(d=3, batchsize=100)
y <- apply(cggp$design, 1, function(x){x[1]+x[2]^2+rnorm(1,0,.01)})
CGGP_internal_calcpwanddpw(CGGP=cggp, y=y, theta=cggp$thetaMAP)
```

---

CGGP\_internal\_CorrMatCauchy  
*Cauchy correlation function*

---

### Description

Calculate correlation matrix for two sets of points in one dimension. Note that this is not the correlation between two vectors.

### Usage

```
CGGP_internal_CorrMatCauchy(
  x1,
  x2,
  theta,
  return_dCdtheta = FALSE,
  return_numpara = FALSE,
  returnlogs = FALSE
)
```

### Arguments

x1	Vector of coordinates from same dimension
x2	Vector of coordinates from same dimension
theta	Correlation parameters: <ul style="list-style-type: none"> <li>• LS Log of parameter that controls lengthscale</li> <li>• FD Logit of 0.5*parameter that controls the fractal dimension</li> <li>• HE Log of parameter that controls the hurst effect</li> </ul>
return_dCdtheta	Should dCdtheta be returned?
return_numpara	Should it just return the number of parameters?
returnlogs	Should log of correlation be returned?

### Value

Matrix of correlation values between x1 and x2

### See Also

Other correlation functions: [CGGP\\_internal\\_CorrMatCauchySQT\(\)](#), [CGGP\\_internal\\_CorrMatCauchySQ\(\)](#), [CGGP\\_internal\\_CorrMatGaussian\(\)](#), [CGGP\\_internal\\_CorrMatMatern32\(\)](#), [CGGP\\_internal\\_CorrMatMatern52\(\)](#), [CGGP\\_internal\\_CorrMatPowerExp\(\)](#), [CGGP\\_internal\\_CorrMatWendland0\(\)](#), [CGGP\\_internal\\_CorrMatWendland1\(\)](#), [CGGP\\_internal\\_CorrMatWendland2\(\)](#)

### Examples

```
CGGP_internal_CorrMatCauchy(c(0,.2,.4),c(.1,.3,.5), theta=c(-1,.9,.1))
```

---

CGGP\_internal\_CorrMatCauchySQ  
*CauchySQ correlation function*

---

**Description**

Calculate correlation matrix for two sets of points in one dimension Note that this is not the correlation between two vectors.

**Usage**

```
CGGP_internal_CorrMatCauchySQ(
  x1,
  x2,
  theta,
  return_dCdtheta = FALSE,
  return_numpara = FALSE,
  returnlogs = FALSE
)
```

**Arguments**

x1	Vector of coordinates from same dimension
x2	Vector of coordinates from same dimension
theta	Correlation parameters: <ul style="list-style-type: none"> <li>• LS Log of parameter that controls lengthscale</li> <li>• FD Logit of 0.5*parameter that controls the fractal dimension</li> <li>• HE Log of parameter that controls the hurst effect</li> </ul>
return_dCdtheta	Should dCdtheta be returned?
return_numpara	Should it just return the number of parameters?
returnlogs	Should log of correlation be returned?

**Value**

Matrix of correlation values between x1 and x2

**See Also**

Other correlation functions: [CGGP\\_internal\\_CorrMatCauchySQ\(\)](#), [CGGP\\_internal\\_CorrMatCauchy\(\)](#), [CGGP\\_internal\\_CorrMatGaussian\(\)](#), [CGGP\\_internal\\_CorrMatMatern32\(\)](#), [CGGP\\_internal\\_CorrMatMatern52\(\)](#), [CGGP\\_internal\\_CorrMatPowerExp\(\)](#), [CGGP\\_internal\\_CorrMatWendland0\(\)](#), [CGGP\\_internal\\_CorrMatWendland1\(\)](#), [CGGP\\_internal\\_CorrMatWendland2\(\)](#)

**Examples**

```
CGGP_internal_CorrMatCauchySQ(c(0,.2,.4),c(.1,.3,.5), theta=c(-.7,-.5))
```

---

CGGP\_internal\_CorrMatCauchySQT  
*CauchySQT correlation function*

---

### Description

Calculate correlation matrix for two sets of points in one dimension. Note that this is not the correlation between two vectors.

### Usage

```
CGGP_internal_CorrMatCauchySQT(
  x1,
  x2,
  theta,
  return_dCdtheta = FALSE,
  return_numpara = FALSE,
  returnlogs = FALSE
)
```

### Arguments

x1	Vector of coordinates from same dimension
x2	Vector of coordinates from same dimension
theta	Correlation parameters: <ul style="list-style-type: none"> <li>• LS Log of parameter that controls lengthscale</li> <li>• FD Logit of 0.5*parameter that controls the fractal dimension</li> <li>• HE Log of parameter that controls the hurst effect</li> </ul>
return_dCdtheta	Should dCdtheta be returned?
return_numpara	Should it just return the number of parameters?
returnlogs	Should log of correlation be returned?

### Value

Matrix of correlation values between x1 and x2

### See Also

Other correlation functions: [CGGP\\_internal\\_CorrMatCauchySQ\(\)](#), [CGGP\\_internal\\_CorrMatCauchy\(\)](#), [CGGP\\_internal\\_CorrMatGaussian\(\)](#), [CGGP\\_internal\\_CorrMatMatern32\(\)](#), [CGGP\\_internal\\_CorrMatMatern52\(\)](#), [CGGP\\_internal\\_CorrMatPowerExp\(\)](#), [CGGP\\_internal\\_CorrMatWendland0\(\)](#), [CGGP\\_internal\\_CorrMatWendland1\(\)](#), [CGGP\\_internal\\_CorrMatWendland2\(\)](#)

### Examples

```
CGGP_internal_CorrMatCauchySQT(c(0,.2,.4),c(.1,.3,.5), theta=c(-.1,.3,-.7))
```

---

CGGP\_internal\_CorrMatGaussian  
*Gaussian correlation function*

---

### Description

Calculate correlation matrix for two sets of points in one dimension Note that this is not the correlation between two vectors.

### Usage

```
CGGP_internal_CorrMatGaussian(
  x1,
  x2,
  theta,
  return_dCdtheta = FALSE,
  return_numpara = FALSE,
  returnlogs = FALSE
)
```

### Arguments

x1	Vector of coordinates from same dimension
x2	Vector of coordinates from same dimension
theta	Correlation parameters: <ul style="list-style-type: none"> <li>• LS Log of parameter that controls lengthscale</li> <li>• FD Logit of 0.5*parameter that controls the fractal dimension</li> <li>• HE Log of parameter that controls the hurst effect</li> </ul>
return_dCdtheta	Should dCdtheta be returned?
return_numpara	Should it just return the number of parameters?
returnlogs	Should log of correlation be returned?

### Details

WE HIGHLY ADVISE NOT USING THIS CORRELATION FUNCTION. Try Power Exponential, CauchySQT, Cauchy, or Matern 3/2 instead.

### Value

Matrix of correlation values between x1 and x2

**See Also**

Other correlation functions: [CGGP\\_internal\\_CorrMatCauchySQT\(\)](#), [CGGP\\_internal\\_CorrMatCauchySQ\(\)](#), [CGGP\\_internal\\_CorrMatCauchy\(\)](#), [CGGP\\_internal\\_CorrMatMatern32\(\)](#), [CGGP\\_internal\\_CorrMatMatern52\(\)](#), [CGGP\\_internal\\_CorrMatPowerExp\(\)](#), [CGGP\\_internal\\_CorrMatWendland0\(\)](#), [CGGP\\_internal\\_CorrMatWendland1\(\)](#), [CGGP\\_internal\\_CorrMatWendland2\(\)](#)

**Examples**

```
CGGP_internal_CorrMatGaussian(c(0,.2,.4),c(.1,.3,.5), theta=c(-.7))
```

---

```
CGGP_internal_CorrMatMatern32
```

*Matern 3/2 correlation function*

---

**Description**

Calculate correlation matrix for two sets of points in one dimension. Note that this is not the correlation between two vectors.

**Usage**

```
CGGP_internal_CorrMatMatern32(  
  x1,  
  x2,  
  theta,  
  return_dCdtheta = FALSE,  
  return_numpara = FALSE,  
  returnlogs = FALSE  
)
```

**Arguments**

x1	Vector of coordinates from same dimension
x2	Vector of coordinates from same dimension
theta	Correlation parameters: <ul style="list-style-type: none"> <li>• LS Log of parameter that controls lengthscale</li> <li>• FD Logit of 0.5*parameter that controls the fractal dimension</li> <li>• HE Log of parameter that controls the hurst effect</li> </ul>
return_dCdtheta	Should dCdtheta be returned?
return_numpara	Should it just return the number of parameters?
returnlogs	Should log of correlation be returned?

**Value**

Matrix of correlation values between x1 and x2

**See Also**

Other correlation functions: [CGGP\\_internal\\_CorrMatCauchySQT\(\)](#), [CGGP\\_internal\\_CorrMatCauchySQ\(\)](#), [CGGP\\_internal\\_CorrMatCauchy\(\)](#), [CGGP\\_internal\\_CorrMatGaussian\(\)](#), [CGGP\\_internal\\_CorrMatMatern52\(\)](#), [CGGP\\_internal\\_CorrMatPowerExp\(\)](#), [CGGP\\_internal\\_CorrMatWendland0\(\)](#), [CGGP\\_internal\\_CorrMatWendland1\(\)](#), [CGGP\\_internal\\_CorrMatWendland2\(\)](#)

**Examples**

```
CGGP_internal_CorrMatMatern32(c(0,.2,.4),c(.1,.3,.5), theta=c(-.7))
```

---

```
CGGP_internal_CorrMatMatern52
```

*Matern 5/2 correlation function*

---

**Description**

Calculate correlation matrix for two sets of points in one dimension. Note that this is not the correlation between two vectors.

**Usage**

```
CGGP_internal_CorrMatMatern52(
  x1,
  x2,
  theta,
  return_dCdtheta = FALSE,
  return_numpara = FALSE,
  returnlogs = FALSE
)
```

**Arguments**

x1	Vector of coordinates from same dimension
x2	Vector of coordinates from same dimension
theta	Correlation parameters: <ul style="list-style-type: none"> <li>• LS Log of parameter that controls lengthscale</li> <li>• FD Logit of 0.5*parameter that controls the fractal dimension</li> <li>• HE Log of parameter that controls the hurst effect</li> </ul>
return_dCdtheta	Should dCdtheta be returned?
return_numpara	Should it just return the number of parameters?
returnlogs	Should log of correlation be returned?

**Value**

Matrix of correlation values between x1 and x2

**See Also**

Other correlation functions: [CGGP\\_internal\\_CorrMatCauchySQT\(\)](#), [CGGP\\_internal\\_CorrMatCauchySQ\(\)](#), [CGGP\\_internal\\_CorrMatCauchy\(\)](#), [CGGP\\_internal\\_CorrMatGaussian\(\)](#), [CGGP\\_internal\\_CorrMatMatern32\(\)](#), [CGGP\\_internal\\_CorrMatPowerExp\(\)](#), [CGGP\\_internal\\_CorrMatWendland0\(\)](#), [CGGP\\_internal\\_CorrMatWendland1\(\)](#), [CGGP\\_internal\\_CorrMatWendland2\(\)](#)

**Examples**

```
CGGP_internal_CorrMatMatern52(c(0,.2,.4),c(.1,.3,.5), theta=c(-.7))
```

---

```
CGGP_internal_CorrMatPowerExp
```

*Power exponential correlation function*

---

**Description**

Calculate correlation matrix for two sets of points in one dimension. Note that this is not the correlation between two vectors.

**Usage**

```
CGGP_internal_CorrMatPowerExp(
  x1,
  x2,
  theta,
  return_dCdtheta = FALSE,
  return_numpara = FALSE,
  returnlogs = FALSE
)
```

**Arguments**

x1	Vector of coordinates from same dimension
x2	Vector of coordinates from same dimension
theta	Correlation parameters: <ul style="list-style-type: none"> <li>• LS Log of parameter that controls lengthscale</li> <li>• FD Logit of 0.5*parameter that controls the fractal dimension</li> <li>• HE Log of parameter that controls the hurst effect</li> </ul>
return_dCdtheta	Should dCdtheta be returned?
return_numpara	Should it just return the number of parameters?
returnlogs	Should log of correlation be returned?

**Value**

Matrix of correlation values between x1 and x2

**See Also**

Other correlation functions: [CGGP\\_internal\\_CorrMatCauchySQT\(\)](#), [CGGP\\_internal\\_CorrMatCauchySQ\(\)](#), [CGGP\\_internal\\_CorrMatCauchy\(\)](#), [CGGP\\_internal\\_CorrMatGaussian\(\)](#), [CGGP\\_internal\\_CorrMatMatern32\(\)](#), [CGGP\\_internal\\_CorrMatMatern52\(\)](#), [CGGP\\_internal\\_CorrMatWendland0\(\)](#), [CGGP\\_internal\\_CorrMatWendland1\(\)](#), [CGGP\\_internal\\_CorrMatWendland2\(\)](#)

**Examples**

```
CGGP_internal_CorrMatPowerExp(c(0,.2,.4),c(.1,.3,.5), theta=c(-.7,.2))
```

---

```
CGGP_internal_CorrMatWendland0
```

*Wendland0 (Triangle) correlation function*

---

**Description**

Calculate correlation matrix for two sets of points in one dimension. Note that this is not the correlation between two vectors.

**Usage**

```
CGGP_internal_CorrMatWendland0(
  x1,
  x2,
  theta,
  return_dCdtheta = FALSE,
  return_numpara = FALSE,
  returnlogs = FALSE
)
```

**Arguments**

x1	Vector of coordinates from same dimension
x2	Vector of coordinates from same dimension
theta	Correlation parameters: <ul style="list-style-type: none"> <li>• LS Log of parameter that controls lengthscale</li> <li>• FD Logit of 0.5*parameter that controls the fractal dimension</li> <li>• HE Log of parameter that controls the hurst effect</li> </ul>
return_dCdtheta	Should dCdtheta be returned?
return_numpara	Should it just return the number of parameters?
returnlogs	Should log of correlation be returned?

**Value**

Matrix of correlation values between x1 and x2

**See Also**

Other correlation functions: [CGGP\\_internal\\_CorrMatCauchySQT\(\)](#), [CGGP\\_internal\\_CorrMatCauchySQ\(\)](#), [CGGP\\_internal\\_CorrMatCauchy\(\)](#), [CGGP\\_internal\\_CorrMatGaussian\(\)](#), [CGGP\\_internal\\_CorrMatMatern32\(\)](#), [CGGP\\_internal\\_CorrMatMatern52\(\)](#), [CGGP\\_internal\\_CorrMatPowerExp\(\)](#), [CGGP\\_internal\\_CorrMatWendland1\(\)](#), [CGGP\\_internal\\_CorrMatWendland2\(\)](#)

**Examples**

```
CGGP_internal_CorrMatWendland0(c(0,.2,.4),c(.1,.3,.5), theta=-.7)
```

---

```
CGGP_internal_CorrMatWendland1
```

*Wendland1 1 correlation function*

---

**Description**

Calculate correlation matrix for two sets of points in one dimension. Note that this is not the correlation between two vectors.

**Usage**

```
CGGP_internal_CorrMatWendland1(
  x1,
  x2,
  theta,
  return_dCdtheta = FALSE,
  return_numpara = FALSE,
  returnlogs = FALSE
)
```

**Arguments**

x1	Vector of coordinates from same dimension
x2	Vector of coordinates from same dimension
theta	Correlation parameters: <ul style="list-style-type: none"> <li>• LS Log of parameter that controls lengthscale</li> <li>• FD Logit of 0.5*parameter that controls the fractal dimension</li> <li>• HE Log of parameter that controls the hurst effect</li> </ul>
return_dCdtheta	Should dCdtheta be returned?
return_numpara	Should it just return the number of parameters?
returnlogs	Should log of correlation be returned?

**Value**

Matrix of correlation values between x1 and x2

**See Also**

Other correlation functions: [CGGP\\_internal\\_CorrMatCauchySQT\(\)](#), [CGGP\\_internal\\_CorrMatCauchySQ\(\)](#), [CGGP\\_internal\\_CorrMatCauchy\(\)](#), [CGGP\\_internal\\_CorrMatGaussian\(\)](#), [CGGP\\_internal\\_CorrMatMatern32\(\)](#), [CGGP\\_internal\\_CorrMatMatern52\(\)](#), [CGGP\\_internal\\_CorrMatPowerExp\(\)](#), [CGGP\\_internal\\_CorrMatWendland0\(\)](#), [CGGP\\_internal\\_CorrMatWendland2\(\)](#)

**Examples**

```
CGGP_internal_CorrMatWendland1(c(0,.2,.4),c(.1,.3,.5), theta=-.7)
```

---

```
CGGP_internal_CorrMatWendland2
      Wendland2 2 correlation function
```

---

**Description**

Calculate correlation matrix for two sets of points in one dimension. Note that this is not the correlation between two vectors.

**Usage**

```
CGGP_internal_CorrMatWendland2(
  x1,
  x2,
  theta,
  return_dCdtheta = FALSE,
  return_numpara = FALSE,
  returnlogs = FALSE
)
```

**Arguments**

x1	Vector of coordinates from same dimension
x2	Vector of coordinates from same dimension
theta	Correlation parameters: <ul style="list-style-type: none"> <li>• LS Log of parameter that controls lengthscale</li> <li>• FD Logit of 0.5*parameter that controls the fractal dimension</li> <li>• HE Log of parameter that controls the hurst effect</li> </ul>
return_dCdtheta	Should dCdtheta be returned?
return_numpara	Should it just return the number of parameters?
returnlogs	Should log of correlation be returned?

**Value**

Matrix of correlation values between x1 and x2

**See Also**

Other correlation functions: [CGGP\\_internal\\_CorrMatCauchySQT\(\)](#), [CGGP\\_internal\\_CorrMatCauchySQ\(\)](#), [CGGP\\_internal\\_CorrMatCauchy\(\)](#), [CGGP\\_internal\\_CorrMatGaussian\(\)](#), [CGGP\\_internal\\_CorrMatMatern32\(\)](#), [CGGP\\_internal\\_CorrMatMatern52\(\)](#), [CGGP\\_internal\\_CorrMatPowerExp\(\)](#), [CGGP\\_internal\\_CorrMatWendland0\(\)](#), [CGGP\\_internal\\_CorrMatWendland1\(\)](#)

**Examples**

```
CGGP_internal_CorrMatWendland2(c(0,.2,.4),c(.1,.3,.5), theta=-.7)
```

---

```
CGGP_internal_gneglogpost
```

*Gradient of negative log likelihood posterior*

---

**Description**

Gradient of negative log likelihood posterior

**Usage**

```
CGGP_internal_gneglogpost(  
  theta,  
  CGGP,  
  y,  
  ...,  
  return_lik = FALSE,  
  ys = NULL,  
  Xs = NULL,  
  HandlingSuppData = "Correct"  
)
```

**Arguments**

theta	Log of correlation parameters
CGGP	CGGP object
y	CGGP\$design measured values
...	Forces you to name remaining arguments
return_lik	If yes, it returns a list with lik and glik
ys	Supplementary output data
Xs	Supplementary input data
HandlingSuppData	How should supplementary data be handled? * Correct: full likelihood with grid and supplemental data * Only: only use supplemental data * Ignore: ignore supplemental data

**Value**

Vector for gradient of likelihood w.r.t.  $x$  (theta)

**Examples**

```
cg <- CGGPcreate(d=3, batchsize=20)
Y <- apply(cg$design, 1, function(x){x[1]+x[2]^2})
cg <- CGGPfit(cg, Y)
CGGP_internal_neglogpost(cg$thetaMAP, CGGP=cg, y=cg$y)
```

---

CGGP\_internal\_MSEpredcalc

*Calculate MSE prediction along a single dimension*

---

**Description**

Calculate MSE prediction along a single dimension

**Usage**

```
CGGP_internal_MSEpredcalc(xp, x1, theta, CorrMat)
```

**Arguments**

xp	Points at which to calculate MSE
x1	Levels along dimension, vector???
theta	Correlation parameters
CorrMat	Function that gives correlation matrix for vectors of 1D points.

**Value**

MSE predictions

**Examples**

```
CGGP_internal_MSEpredcalc(c(.4,.52), c(0,.25,.5,.75,1), theta=c(.1,.2),
  CorrMat=CGGP_internal_CorrMatCauchySQ)
```

---

CGGP\_internal\_neglogpost  
*Calculate negative log posterior*

---

### Description

Calculate negative log posterior

### Usage

```
CGGP_internal_neglogpost(  
  theta,  
  CGGP,  
  y,  
  ...,  
  ys = NULL,  
  Xs = NULL,  
  HandlingSuppData = "Correct"  
)
```

### Arguments

theta	Correlation parameters
CGGP	CGGP object
y	Measured values of CGGP\$design
...	Forces you to name remaining arguments
ys	Supplementary output data
Xs	Supplementary input data
HandlingSuppData	How should supplementary data be handled? <ul style="list-style-type: none"><li>• Correct: full likelihood with grid and supplemental data</li><li>• Only: only use supplemental data</li><li>• Ignore: ignore supplemental data</li></ul>

### Value

Likelihood

### Examples

```
cg <- CGGPcreate(d=3, batchsize=20)  
Y <- apply(cg$design, 1, function(x){x[1]+x[2]^2})  
cg <- CGGPfit(cg, Y)  
CGGP_internal_neglogpost(cg$thetaMAP, CGGP=cg, y=cg$y)
```

---

 CGGP\_internal\_set\_corr

*Set correlation function of CGGP object*

---

**Description**

Set correlation function of CGGP object

**Usage**

```
CGGP_internal_set_corr(CGGP, corr)
```

**Arguments**

CGGP	CGGP object
corr	Correlation function

**Value**

CGGP object

**Examples**

```
obj <- CGGPcreate(3, 20, corr="matern52")
CGGP_internal_set_corr(obj, "gaussian")
```

---

 plot.CGGP

*S3 plot method for CGGP*

---

**Description**

There are a few different plot functions for CGGP objects: 'CGGPplotblocks', 'CGGPplotblock-selection', 'CGGPplotcorr', 'CGGPplotheat', 'CGGPplothis', 'CGGPvalplot', 'CGGPplotslice', 'CGGPplotslice', and 'CGGPplotvariogram'. Currently 'CGGPplotblocks' is the default plot object.

**Usage**

```
## S3 method for class 'CGGP'
plot(x, y, ...)
```

**Arguments**

x	CGGP object
y	Don't use
...	Passed to CGGPplotblocks

**Value**

Either makes plot or returns plot object

**Examples**

```
SG = CGGPcreate(3,100)
plot(SG)
```

---

predict.CGGP

*S3 predict method for CGGP*

---

**Description**

Passes to CGGPpred

Predict using SG with y values at xp? Shouldn't y values already be stored in SG?

**Usage**

```
## S3 method for class 'CGGP'
predict(object, xp, ...)

CGGPpred(CGGP, xp, theta = NULL, outdims = NULL)
```

**Arguments**

object	CGGP object
xp	x value to predict at
...	Other arguments passed to 'CGGPpred'
CGGP	SG object
theta	Leave as NULL unless you want to use a value other than thetaMAP. Much slower.
outdims	If multiple outputs fit without PCA and with separate parameters, you can predict just for certain dimensions to speed it up. Will leave other columns in the output, but they will be wrong.

**Value**

Predicted mean values

**See Also**

Other CGGP core functions: [CGGPappend\(\)](#), [CGGPcreate\(\)](#), [CGGPfit\(\)](#)

**Examples**

```

SG <- CGGPcreate(d=3, batchsize=100)
y <- apply(SG$design, 1, function(x){x[1]+x[2]^2+rnorm(1,0,.01)})
SG <- CGGPfit(SG, Y=y)
CGGPpred(SG, matrix(c(.1,.1,.1),1,3))
cbind(CGGPpred(SG, SG$design)$mean, y) # Should be near equal

```

---

print.CGGP	<i>Print CGGP object</i>
------------	--------------------------

---

**Description**

Default print as a list is bad since there's a lot of elements.

**Usage**

```

## S3 method for class 'CGGP'
print(x, ...)

```

**Arguments**

x	CGGP object
...	Passed to print

**Value**

String to be printed

**Examples**

```

SG = CGGPcreate(3,21)
print(SG)
f <- function(x) {x[1]+exp(x[2]) + log(x[3]+4)}
y <- apply(SG$design, 1, f)
SG <- CGGPfit(SG, y)
print(SG)

```

---

`rcpp_fastmatclcr`      *rcpp\_fastmatclcr*

---

**Description**

`rcpp_fastmatclcr`

**Usage**

`rcpp_fastmatclcr(I, w, MSEmat, S, maxlevel)`

**Arguments**

<code>I</code>	Matrix
<code>w</code>	vector
<code>MSEmat</code>	Matrix
<code>S</code>	Vector
<code>maxlevel</code>	Integer

**Value**

Nothing, void

---

`rcpp_fastmatclcranddclcr`  
*rcpp\_fastmatclcranddclcr*

---

**Description**

`rcpp_fastmatclcranddclcr`

**Usage**

`rcpp_fastmatclcranddclcr(I, w, MSEmat, dMSEmat, S, dS, maxlevel, numpara)`

**Arguments**

<code>I</code>	Matrix
<code>w</code>	vector
<code>MSEmat</code>	Matrix
<code>dMSEmat</code>	Matrix
<code>S</code>	Vector
<code>dS</code>	Matrix
<code>maxlevel</code>	Integer
<code>numpara</code>	Integer

**Value**

Nothing, void

---

rcpp_gkronDBS	<i>rcpp_kronDBS</i>
---------------	---------------------

---

**Description**

rcpp\_kronDBS

**Usage**

rcpp\_gkronDBS(A, dA, B, p)

**Arguments**

A	Vector
dA	Vector
B	Vector
p	Vector

**Value**

kronDBS calculation

**Examples**

rcpp\_gkronDBS(c(1,1), c(0,0), c(.75), c(1,1))

---

rcpp_kronDBS	<i>rcpp_kronDBS</i>
--------------	---------------------

---

**Description**

rcpp\_kronDBS

**Usage**

rcpp\_kronDBS(A, B, p)

**Arguments**

A	Vector
B	Vector
p	Vector

**Value**

kronDBS calculation

---

valplot

*Plot validation prediction errors*

---

**Description**

Plot validation prediction errors

**Usage**

```
valplot(predmean, predvar, Yval, d = NULL)
```

**Arguments**

predmean	Predicted mean
predvar	Predicted variance
Yval	Y validation data
d	If output is multivariate, which column to use. Will do all if left as NULL.

**Value**

None, makes a plot

**Examples**

```
x <- matrix(runif(100*3), ncol=3)
f1 <- function(x){x[1]+x[2]^2}
y <- apply(x, 1, f1)
# Create a linear model on the data
mod <- lm(y ~ ., data.frame(x))
# Predict at validation data
Xval <- matrix(runif(3*100), ncol=3)
mod.pred <- predict.lm(mod, data.frame(Xval), se.fit=TRUE)
# Compare to true results
Yval <- apply(Xval, 1, f1)
valplot(mod.pred$fit, mod.pred$se.fit^2, Yval=Yval)
```

---

valstats	<i>Calculate stats for prediction on validation data</i>
----------	--

---

**Description**

Calculate stats for prediction on validation data

**Usage**

```
valstats(
  predmean,
  predvar,
  Yval,
  bydim = TRUE,
  RMSE = TRUE,
  score = TRUE,
  CRPscore = TRUE,
  coverage = TRUE,
  corr = TRUE,
  R2 = TRUE,
  MAE = FALSE,
  MIS90 = FALSE,
  metrics,
  min_var = .Machine$double.eps
)
```

**Arguments**

predmean	Predicted mean
predvar	Predicted variance
Yval	Y validation data
bydim	If multiple outputs, should it be done separately by dimension?
RMSE	Should root mean squared error (RMSE) be included?
score	Should score be included?
CRPscore	Should CRP score be included?
coverage	Should coverage be included?
corr	Should correlation between predicted and true mean be included?
R2	Should R <sup>2</sup> be included?
MAE	Should mean absolute error (MAE) be included?
MIS90	Should mean interval score for 90% confidence be included? See Gneiting and Raftery (2007).
metrics	Optional additional metrics to be calculated. Should have same first three parameters as this function.
min_var	Minimum value of the predicted variance. Negative or zero variances can cause errors.

**Value**

data frame

**References**

Gneiting, Tilmann, and Adrian E. Raftery. "Strictly proper scoring rules, prediction, and estimation." *Journal of the American Statistical Association* 102.477 (2007): 359-378.

**Examples**

```
valstats(c(0,1,2), c(.01,.01,.01), c(0,1.1,1.9))
valstats(cbind(c(0,1,2), c(1,2,3)),
         cbind(c(.01,.01,.01),c(.1,.1,.1)),
         cbind(c(0,1.1,1.9),c(1,2,3)))
valstats(cbind(c(0,1,2), c(8,12,34)),
         cbind(c(.01,.01,.01),c(1.1,.81,1.1)),
         cbind(c(0,1.1,1.9),c(10,20,30)), bydim=FALSE)
valstats(cbind(c(.8,1.2,3.4), c(8,12,34)),
