Title Estimation of Lifetime Attributable Risk of Cancer from Radiation Exposure

Version 1.0.0

Maintainer Juhee Lee <ljh988488@gmail.com>

Description Compute lifetime attributable risk of radiation-induced cancer reveals that it can be helpful with enhancement of the flexibility in research with fast calculation and various options. Important reference papers include Berrington de Gonzalez et al. (2012) <[doi:10.1088/0952-4746/32/3/205](https://doi.org/10.1088/0952-4746/32/3/205)>, National Research Council (2006, ISBN:978-0-309-09156-5).

incid2010	<i>Cancer incidence table of Korea 2010</i>
-----------	---

Description

A dataset containing the crude incidence rate of death by age, cancer site and gender.

Usage

```
incid2010
```

Format

A data frame with 1919 rows and 4 variables:

Site cancer site

Age age

Rate_m crude incidence rate for male

Rate_f crude incidence rate for female

Source

KOSIS(Ministry of Health and Welfare, Cancer Registration Statistics) <https://kosis.kr/>

`incid2018`*Cancer incidence table of Korea 2018*

Description

A dataset containing the crude incidence rate of death by age, cancer site and gender.

Usage`incid2018`**Format**

A data frame with 1919 rows and 4 variables:

Site cancer site

Age age

Rate_m crude incidence rate for male

Rate_f crude incidence rate for female

Source

KOSIS(Ministry of Health and Welfare, Cancer Registration Statistics) <https://kosis.kr/>

`LAR`*Estimate Lifetime Attributable Risk for one person*

Description

LAR is used to estimate lifetime attributable radiation-related cancer risk for data with one person.

Usage

```
LAR(  
  data,  
  basedata,  
  sim = 300,  
  seed = 99,  
  current = as.numeric(substr(Sys.Date(), 1, 4)),  
  ci = 0.9,  
  weight = NULL,  
  DDREF = TRUE,  
  basepy = 1e+05  
)
```

Arguments

<code>data</code>	data frame containing demographic information and exposure information. See 'Details'.
<code>basedata</code>	a list of the data of lifetime table and incidence rate table. The first element is lifetime table and the second is incidence rate table.
<code>sim</code>	number of iteration of simulation.
<code>seed</code>	a random seed number.
<code>current</code>	a current year. default is year of the system time.
<code>ci</code>	confidence level of the confidence interval.
<code>weight</code>	a list containing the value between 0 and 1 which is a weight on ERR model. See 'Details'.
<code>DDREF</code>	logical. Whether to apply the dose and dose-rate effectiveness factor.
<code>basepy</code>	number of base person-years

Details

The maximum age in LAR is set as 100. If the data contains `birth` which makes attained age ($=\text{current} - \text{birth}$) exceed 100, the result has no useful value.

`data` should include information which includes gender, year of birth, year of exposure, sites where exposed, exposure rate, distribution of dose and dose parameters of exposed radiation. The name of each variables must be `sex`, `birth`, `exposure`, `site`, `exposure_rate`, `dosedist`, `dose1`, `dose2`, `dose3`.

For some variables, there is a fixed format. `sex` can have the component 'male' or 'female'. `site` can have the component 'stomach', 'colon', 'liver', 'lung', 'breast', 'ovary', 'uterus', 'prostate', 'bladder', 'brain/cns', 'thyroid', 'remainder', 'oral', 'oesophagus', 'rectum', 'gallbladder', 'pancreas', 'kidney', 'leukemia'. `exposure_rate` can have the component 'acute' or 'chronic'. `dosedist` can have the component 'fixedvalue', 'lognormal', 'normal', 'triangular', 'logtriangular', 'uniform', 'loguniform'.

`dose1`, `dose2`, `dose3` are parameters of dose distribution. The parameters for each distribution are that:

fixedvalue dose value (`dose1`)

lognormal median (`dose1`), geometric standard deviation (`dose2`)

normal mean (`dose1`), standard deviation (`dose2`)

triangular or logtriangular minimum (`dose1`), mode (`dose2`), maximum (`dose3`)

uniform or loguniform minimum (`dose1`), maximum (`dose2`)

`weight`

Value

LAR returns an object of "LAR" class.

An object of class "LAR" is a list containing the following components:

LAR Lifetime attributable risk (LAR) from the time of exposure to the end of the expected lifetime.

F_LAR Future attributable risk from current to the expected lifetime.

LBR Lifetime baseline risk.

BFR Baseline future risk.

LFR Lifetime fractional risk.

TFR Total future risk.

current Current year.

ci Confidence level.

pinfo Information of the person.

Examples

```
## example with lifetime and incidence rate table in 2010 Korea.
organ2 <- split(organ, organ$ID)[[1]]  ## data of one person.

## default
lar1 <- LAR(organ2, basedata = list(life2010, incid2010))
summary(lar1)

## change the weight for ERR and EAR models
weight_list <- list("rectum" = 0.5)
lar2 <- LAR(organ2, basedata = list(life2010, incid2010), weight = weight_list)
summary(lar2)

## change the DDREF option (DDREF=FALSE)
lar3 <- LAR(organ2, basedata = list(life2010, incid2010), DDREF = FALSE)
summary(lar3)
```

 LAR_batch

Estimate Lifetime Attributable Risk for several people

Description

LAR_batch is used to estimate lifetime attributable radiation-related cancer risk for data with several people.

Usage

```
LAR_batch(
  data,
  pid,
  basedata,
  sim = 300,
  seed = 99,
  current = as.numeric(substr(Sys.Date(), 1, 4)),
  ci = 0.9,
  weight = NULL,
  DDREF = TRUE,
  basepy = 1e+05
)
```

Arguments

data	data frame containing demographic information and exposure information. See 'Details'.
pid	a vector which distinguish each person.
basedata	a list of the data of lifetime table and incidence rate table. The first element is lifetime table and the second is incidence rate table.
sim	number of iteration of simulation.
seed	a random seed number.
current	a current year. default is year of the system time.
ci	confidence level of the confidence interval.
weight	a list containing the value between 0 and 1 which is a weight on ERR model. See 'Details'.
DDREF	logical. Whether to apply the dose and dose-rate effectiveness factor.
basepy	number of base person-years

Value

LAR_batch returns an object of multiple classes "LAR_batch", "LAR". An object of class LAR_batch is a list of LAR class objects which names of elements are ID of each person.

summary(lar1)
```

LAR_group

Average Estimated Lifetime Attributable Risk by Group

Description

LAR_group is used to estimate lifetime attributable radiation-related cancer risk by group.

Usage

```
LAR_group(  
  data,  
  pid,  
  group,  
  basedata,  
  sim = 300,  
  seed = 99,  
  current = as.numeric(substr(Sys.Date(), 1, 4)),  
  ci = 0.9,  
  weight = NULL,  
  DDREF = TRUE,  
  basepy = 1e+05  
)
```

Arguments

data	data frame containing demographic information and exposure information. See 'Details'.
pid	a vector which distinguish each person.
group	a vector or list of vectors which distinguish each group.
basedata	a list of the data of lifetime table and incidence rate table. The first element is lifetime table and the second is incidence rate table.
sim	number of iteration of simulation.
seed	a random seed number.
current	a current year. default is year of the system time.
ci	confidence level of the confidence interval.
weight	a list containing the value between 0 and 1 which is a weight on ERR model. See 'Details'.
DDREF	logical. Whether to apply the dose and dose-rate effectiveness factor.
basepy	number of base person-years

Value

LAR_group returns an object of multiple classes "LAR_group", "LAR". An object of class LAR_group is a list of LAR class objects which names of elements are group of each groups.

                 basedata = list(life2010, incid2010))
summary(lar1)

lar2 <- LAR_group(nuclear, pid=nuclear$ID, group=list(nuclear$sex, nuclear$distance),
                 basedata = list(life2010, incid2010))
summary(lar2)
```

life2010	<i>Lifetime table of Korea 2010</i>
----------	-------------------------------------

Description

A dataset containing the probability of death by age and gender.

Usage

```
life2010
```

Format

A data frame with 101 rows and 3 variables:

Age age

Prob_d_m probability of death for male

Prob_d_f probability of death for female

Source

KOSIS(Statistics Korea, Life Tables By Province) <https://kosis.kr/>

life2018	<i>Lifetime table of Korea 2018</i>
----------	-------------------------------------

Description

A dataset containing the probability of death by age and gender.

Usage

```
life2018
```

Format

A data frame with 101 rows and 3 variables:

Age age

Prob_d_m probability of death for male

Prob_d_f probability of death for female

Source

KOSIS(Statistics Korea, Life Tables By Province) <https://kosis.kr/>

 nuclear

Simulated data of organ radiation exposure dose

Description

nuclear is simulated dataset for acute exposure event. The scenario assumes that the people exposure the radiation at 2011.

Usage

nuclear

Format

A data frame with 100 observation of 11 variables:

ID person ID.

sex gender

birth birth-year

exposure exposed year to radiation

site organ where exposed to radiation

exposure_rate exposure rate

dosedist distribution of dose

dose1 dose parameter

dose2 dose parameter

dose3 dose parameter

distance distance from the hyper

 organ

Simulated data of organ radiation exposure dose

Description

organ is simulated dataset from the data of workers at interventional radiology departments.

Usage

organ

Format

A data frame with 971 observation of 11 variables:

ID person ID.
 sex gender
 birth birth-year
 exposure exposed year to radiation
 site organ where exposed to radiation
 exposure_rate exposure rate
 dosedist distribution of dose
 dose1 dose parameter
 dose2 dose parameter
 dose3 dose parameter
 occup occupation

References

Lee, W. J., Bang, Y. J., Cha, E. S., Kim, Y. M., & Cho, S. B. (2021). Lifetime cancer risks from occupational radiation exposure among workers at interventional radiology departments. *International Archives of Occupational and Environmental Health*, **94**(1), 139-145.

print.LAR	<i>Print estimated Lifetime Attributable Risk for one person</i>
-----------	--

Description

print.LAR is the basic function for printing class "LAR".

Usage

```
## S3 method for class 'LAR'
print(x, digits = 4, ...)

## S3 method for class 'LAR_batch'
print(x, digits = 4, max.id = 50, ...)

## S3 method for class 'LAR_group'
print(x, digits = 4, max.id = 50, ...)
```

Arguments

x	'LAR', 'LAR_batch' or 'LAR_group' object.
digits	the number of decimal points to print.
...	further arguments to be passed from or to other methods.
max.id	the number of maximum of printing LAR results.

summary.LAR

Summarize estimated Lifetime Attributable Risk for one person

Description

summary.LAR is the function for printing class "LAR".

Usage

```
## S3 method for class 'LAR'
summary(object, digits = 4, ...)

## S3 method for class 'LAR_batch'
summary(object, digits = 4, max.id = 50, ...)

## S3 method for class 'LAR_group'
summary(object, digits = 4, max.id = 50, ...)
```

Arguments

object	object of class 'LAR_batch' or LAR'.
digits	the number of decimal points to print.
...	further arguments to be passed from or to other methods.
max.id	the number of maximum of printing LAR results.

write_LAR

Write a LAR object

Description

Write 'LAR' object to CSV file

Usage

```
write_LAR(x, filename)

## S3 method for class 'LAR'
write_LAR(x, filename)

## S3 method for class 'LAR_batch'
write_LAR(x, filename)

## S3 method for class 'LAR_group'
write_LAR(x, filename)
```

Arguments

x	a 'LAR' object.
filename	a string naming the file to save (.csv file)

Methods (by class)

- LAR: write an 'LAR' class object
- LAR_batch: write an 'LAR_batch' class object
- LAR_group: write an 'LAR_group' class object
