Package 'ReliaLearnR'

May 7, 2026

Type Package

Title Learning Modules for Reliability Analysis

Version 0.3

URL https://paulgovan.github.io/ReliaLearnR/, https://github.com/paulgovan/ReliaLearnR

BugReports https://github.com/paulgovan/ReliaLearnR/issues

Description Learning modules for reliability analysis including modules for Reliability, Availability, and Maintainability (RAM) Analysis, Life Data Analysis, and Reliability Testing.

Imports learnr, ReliaGrowR, WeibullR, WeibullR.ALT

Suggests knitr, mockery, ReliaPlotR, ReliaShiny, rmarkdown, testthat (>= 3.0.0)

License CC BY 4.0

Encoding UTF-8

RoxygenNote 7.3.3

VignetteBuilder knitr

Config/testthat/edition 3

NeedsCompilation no

Contents

`avail` *Availability (1 - unavailability / total)*

Description

Availability is the proportion of time a system is in a functioning condition. This function computes availability given unavailable times and total times.

Usage

```
avail(unavailTime, totalTime)
```

Arguments

`unavailTime`	Numeric scalar or numeric vector of unavailable times.
`totalTime`	Numeric scalar or numeric vector of total times (same units as unavailTime).

Value

Numeric scalar: availability for the period (between 0 and 1).

Examples

```
avail(100, 1000)
avail(c(5,10), c(500,600))
```

`fr` *Failure rate (lambda)*

Description

Failure rate is the frequency with which an engineered system or component fails, expressed in failures per unit of time. This function computes failure rate given failure counts and total operating times.

Usage

```
fr(failures, totalTime)
```

Arguments

`failures`	Numeric scalar or numeric vector of failure counts (non-negative).
`totalTime`	Numeric scalar or numeric vector of total operating times.

Value

Numeric scalar: failures per unit time (failures / totalTime).

Examples

```
fr(75, 5000)
fr(c(10,5), c(1000,2000))
```

`lda` *Launch the Life Data Analysis Tutorial*

Description

This function launches an interactive tutorial for life data analysis.

Usage

```
lda()
```

Value

This function does not return a value.

See Also

https://paulgovan.github.io/ReliaLearnR/

Examples

```
if (interactive()) {
  lda()
}
```

mtbf *Mean Time Between Failures (MTBF) for repairable items.*

Description

MTBF = total operating time / number of failures. The MTBF is the expected time between consecutive failures. It is commonly used for repairable items. The behavior is the same as mttf here; keep separate name for semantic clarity.

Usage

```
mtbf(failures, totalTime)
```

Arguments

failures	Numeric scalar or numeric vector of failure counts (non-negative).
totalTime	Numeric scalar or numeric vector of total operating times.

Value

Numeric scalar: MTBF. If number of failures is zero, returns Inf (with a warning).

Examples

```
mtbf(5, 1000)
mtbf(c(2,3), c(500,500))
```

mttf *Mean Time To Failure (MTTF)*

Description

For non-repairable items MTTF = total operating time / number of failures. The MTTF is the expected time to the first failure. It is commonly used for non-repairable items. The behavior implemented is the same as mtbf here; keep separate name for semantic clarity.

Usage

```
mttf(failures, totalTime)
```

Arguments

failures	Numeric scalar or numeric vector of failure counts (non-negative).
totalTime	Numeric scalar or numeric vector of total operating times.

Value

Numeric scalar: MTTF. If number of failures is zero, returns Inf (with a warning).

Examples

```
mttf(5, 1000)
mttf(c(2,3), c(500,500))
```

---

ram *Launch the RAM Analysis Tutorial*

Description

This function launches an interactive tutorial on Reliability, Availability, and Maintainability (RAM) analysis.

Usage

```
ram()
```

Value

This function does not return a value.

See Also

https://paulgovan.github.io/ReliaLearnR/

Examples

```
if (interactive()) {
  ram()
}
```

---

rel *Reliability (1 - outage / total)*

Description

Reliability is the probability that an item will perform its intended function without failure over a specified period under stated conditions. This function computes reliability given outage times and total times.

Usage

```
rel(outageTime, totalTime)
```

Arguments

outageTime	Numeric scalar or numeric vector of forced outage times.
totalTime	Numeric scalar or numeric vector of total times (same units as outageTime).

Value

Numeric scalar: reliability for the period (between 0 and 1).

Examples

```
rel(100, 1000)
rel(c(10,20), c(500, 600))
```

---

rt *Launch the Reliability Testing Tutorial*

Description

This function launches the Reliability Testing tutorial

Usage

```
rt()
```

Value

This function does not return a value.

See Also

Examples

```
if (interactive()) {
  rt()
}
```
