

# Package ‘activityCounts’

May 7, 2026

**Type** Package

**Title** Generate ActiLife Counts

**Version** 0.2.1

**Description** ActiLife software generates activity counts from data collected by Actigraph accelerometers <[https://s3.amazonaws.com/actigraphcorp.com/wp-content/uploads/2017/11/26205758/ActiGraph-White-Paper-What-is-a-Count\\_.pdf](https://s3.amazonaws.com/actigraphcorp.com/wp-content/uploads/2017/11/26205758/ActiGraph-White-Paper-What-is-a-Count_.pdf)>.

Actigraph is one of the most common research-grade accelerometers. There is considerable research validating and developing algorithms for human activity using ActiLife counts. Unfortunately, ActiLife counts are proprietary and difficult to implement if researchers use different accelerometer brands.

The code creates ActiLife counts from raw acceleration data for different accelerometer brands and it is developed

based on the study done by Brond and others (2017) <[doi:10.1249/MSS.0000000000001344](https://doi.org/10.1249/MSS.0000000000001344)>.

**URL** <https://github.com/walkabillylab/activityCounts>,  
<https://github.com/jbrond/ActigraphCounts>

**BugReports** <https://github.com/walkabillylab/activityCounts/issues>

**Depends** R (>= 2.10)

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.2.3

**Suggests** knitr, rmarkdown, ggplot2, testthat (>= 3.0.0)

**VignetteBuilder** knitr

**Imports** seewave, signal, tibble, lubridate, magrittr

**Config/testthat/edition** 3

**NeedsCompilation** no

**Author** Ruben Brondeel [aut],  
Javad Rahimipour Anaraki [aut],  
Daniel Fuller [aut, cph, cre],

SeyedJavad KhataeiPour [aut],  
Beap Lab [cph]

**Maintainer** Daniel Fuller <daniel.fuller@usask.ca>

**Repository** CRAN

**Date/Publication** 2025-04-07 16:10:05 UTC

## Description

Calculates ActiLife counts based on raw accelerometer data

## Usage

```
counts(
  data,
  hertz = -1,
  x_axis = 2,
  y_axis = 3,
  z_axis = 4,
  time_column = -1,
  start_time = -1
)
```

## Arguments

<code>data</code>	Accelerometer data, Must have at least three columns.
<code>hertz</code>	Sampling frequency in Hz
<code>x_axis</code>	Indicates the column number which has the accel data for x direction, the default is 2
<code>y_axis</code>	Indicates the column number which has the accel data for y direction, the default is 3
<code>z_axis</code>	Indicates the column number which has the accel data for z direction, the default is 4

<code>time_column</code>	Optional. Indicates the column number which has the date and time. The first row will be considered as the start time of the study. You can use the "start_time" argument to provide the start time explicitly.
<code>start_time</code>	Optional. Use this to define the start time of the experiment. You can use this argument if the data does not contain a time column.

### Value

Returns a `data.table` with four columns:

**Time** The start time of the measurement

**x** the number of counts for X axis

**y** the number of counts for Y axis

**z** the number of counts for Z axis

### See Also

[sampleXYZ](#) raw accelerometer data for testing `counts()` function.

[sampleCounts](#) counts calculated by `activityCounts` and `ActiLife`

### Examples

```
# for the sampleXYZ dataset, sampling frequency is 100 Hz
counts(data = sampleXYZ, hertz = 100)

# when start time is given explicitly
study_start_time <- "2017-08-22 12:30:10"
counts(data = sampleXYZ, hertz = 100 , start_time = study_start_time)

# the data has a time column, which is the first column
counts(data = sampleXYZ, hertz = 100 , time_column = 1)

# explicitly specify the X, Y and Z axis columns.
counts(data = sampleXYZ, hertz = 100 , x_axis = 2,y_axis = 3, z_axis = 4)
```

---

pptrunc

*pptrunc*

---

### Description

pptrunc

### Usage

```
pptrunc(data, max_value)
```

**Arguments**

data            The variable that will be truncated  
max\_value       The upper bound ( -max\_value is the lower bound)

**Value**

the highest(or the lowest) value of "data" and "max\_value"

---

runsum	<i>runsum</i>
--------	---------------

---

**Description**

runsum

**Usage**

runsum(data, len, threshold)

**Arguments**

data            input data  
len             the length  
threshold      the threshold

**Value**

returns a

---

sampleCounts	<i>The counts calculated by activityCounts and ActiLife based on included raw accelerometer data</i>
--------------	--

---

**Description**

A simple data.table which its first row is measurement time. Then for each time step, counts are calculated by activityCounts and the ActiLife software. The counts are calculated based on included sampleXYZ dataset, which its sampling frequency is 100H.

**Usage**

sampleCounts

**Format**

A data.table with nine columns:

**Time** Date and time

**activityCounts\_x\_counts** counts calculated by counts() function in X direction

**activityCounts\_y\_counts** counts calculated by counts() function in Y direction

**activityCounts\_z\_counts** counts calculated by counts() function in Z direction

**ActiLife\_x\_counts** counts calculated by ActiLife software in X direction

**ActiLife\_y\_counts** counts calculated by ActiLife software in Y direction

**ActiLife\_z\_counts** counts calculated by ActiLife software in Z direction

**See Also**

[counts](#) to see how to produce counts.

[sampleXYZ](#) raw accelerometer data for testing counts() function.

---

sampleXYZ

*Raw accelerometer data for the activityCounts package*

---

**Description**

A simple data.table that contains raw accelerometer data for testing the [counts](#) function. Sampling frequency of this data.table is 100Hz, therefore pass 100 as the second argument when using the [counts](#) function.

**Usage**

```
sampleXYZ
```

**Format**

A data.table with four columns:

**Time** Timestamp

**accelerometer\_X** accelerometer data in X direction

**accelerometer\_Y** accelerometer data in Y direction

**accelerometer\_Z** accelerometer data in Z direction

**See Also**

[counts](#) to see how to produce counts.

[sampleCounts](#) counts calculated by activityCounts and ActiLife

---

trunc

*trunc*

---

**Description**

trunc

**Usage**

trunc(data, min\_value)

**Arguments**

data            The input variable which will be altered if less than the threshold  
min\_value      the threshold which the input below it will be set to zero

**Value**

returns zero if the "data" is less than the "mean\_value" otherwise returns the "data"
