

# Package ‘aftables’

May 7, 2026

**Title** Create Spreadsheet Publications Following Best Practice

**Version** 2.0.1

**Description** Generate spreadsheet publications that follow best practice guidance from the UK government's Analysis Function, available at <https://analysisfunction.civilservice.gov.uk/policy-store/releasing-statistics-in-spreadsheets/>, with a focus on accessibility. See also the 'Python' package 'gptables'.

**License** MIT + file LICENSE

**URL** <https://best-practice-and-impact.github.io/aftables/>,  
<https://github.com/best-practice-and-impact/aftables>

**BugReports** <https://github.com/best-practice-and-impact/aftables/issues>

**Depends** R (>= 4.1.0)

**Imports** openxlsx2, pillar, purrr, dplyr, stringr, tidyselect, tidyr, rlang, utils, yaml, tibble

**Suggests** covr, knitr, rmarkdown, rstudioapi, testthat (>= 3.0.0)

**VignetteBuilder** knitr

**Config/testthat/edition** 3

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.3.3

**NeedsCompilation** no

**Author** Matt Dray [aut],  
Tim Taylor [ctb],  
Matt Kerlogue [ctb],  
Crown Copyright [cph],  
Olivia Box Power [cre, ctb],  
Zachary Gleisner [ctb]

**Maintainer** Olivia Box Power <Olivia.BoxPower@dhsc.gov.uk>

**Repository** CRAN

**Date/Publication** 2026-04-22 12:10:02 UTC

as_aftable	<i>Coerce To An 'aftable' Object</i>
------------	--------------------------------------

---

### Description

Functions to check if an object is an aftable, or coerce it if possible.

### Usage

```
as_aftable(x)
```

```
is_aftable(x)
```

### Arguments

x                    A data.frame object to coerce.

### Value

as\_aftable returns an object of class aftable if possible. is\_aftable returns TRUE if the object has class aftable, otherwise FALSE.

### Examples

```
as_aftable(demo_df)
is_aftable(demo_aftable)
```

---

at\_template\_aftable *Insert 'create\_aftable' template*

---

### **Description**

Insert at the cursor a template for [create\\_aftable](#) from the 'aftables' package, pre-filled with demo data.

### **Usage**

```
at_template_aftable()
```

### **Value**

Empty list. Function is used for side effect.

---

at\_template\_workflow *Insert full 'aftables' template workflow*

---

### **Description**

Insert at the cursor (a) demo templates for cover, contents and notes tables, and (b) a call to [create\\_aftable](#) pre-filled with demo data.

### **Usage**

```
at_template_workflow()
```

### **Value**

Empty list. Function is used for side effect.

---

create\_aftable                      *Create An 'aftable' Object*

---

### Description

Create a new aftable-class object, which is a special data.frame that contains all the information needed in your output spreadsheet. In turn, the object created by this function can be used to populate an 'openxlsx2' wbWorkbook-class object with the function [generate\\_workbook](#).

### Usage

```
create_aftable(
  tab_titles,
  sheet_types = c("cover", "contents", "notes", "tables"),
  sheet_titles,
  blank_cells = NA_character_,
  sources = NA_character_,
  custom_rows = list(NA_character_),
  tables
)
```

### Arguments

tab_titles	Required character vector, one value per sheet. Each title will appear literally on each tab of the final spreadsheet output. Keep brief. Letters and numbers only; do not start with a number; use underscores for spaces. For example: 'Cover', 'Contents', 'Notes', 'Table_1'. Will be corrected automatically unless there's an error.
sheet_types	Required character vector, one value per sheet. Sheets that don't contain publication tables ('meta' sheets) should be of type 'contents', 'cover' or 'notes'. Sheets that contain statistical tables of data are type 'tables'.
sheet_titles	Required character vector, one value per sheet. The main title for each sheet, which will appear in cell A1 (top-left corner).
blank_cells	Optional character vector, one value per sheet. A short sentence to explain the reason for any blank cells in the sheet. Supply as NA_character_ if empty. Most likely to be used with sheet type 'tables'.
sources	Optional character vector, one value per sheet. The origin of the data for a given sheet. Supply as NA_character_ if empty. To be used with sheet type 'tables'.
custom_rows	Optional list of character vectors. One list element per sheet, one character vector element per row of pre-table metadata. Supply a list element as NA_character_ if empty. To be used with sheet type 'tables', but can also be used for sheet types 'contents' and 'notes'.
tables	Required list of data.frames (though the cover sheet may be supplied as a list), one per sheet. See details.

## Details

### How to supply data to the 'tables' argument:

Formats for the elements collected as a list and passed to the 'tables' argument, depending on the sheet type.

- Sheet type 'cover': either (a) a list where each element name is a section header and each element's content is a character vector whose elements will make up separate rows of that section (recommended), or (b) a data.frame with one row per subsection, with one column for section titles and one column for corresponding for that section's body text. For example, you may have a section with the title 'Contact details' that contains an email address and telephone number. You can use line breaks (i.e. '\n') to separate text into paragraphs.
- Sheet type 'contents': one row per sheet, two columns suggested at least (named 'Tab title' and 'Worksheet title').
- Sheet type 'notes': one row per note, two columns suggested (named 'Note number', 'Note text'), where notes are in the form '[note 1]'.
- Sheet type 'tables': a tidy, rectangular data.frame containing the data to be published. It's the user's responsibility to add notes in the form '[note 1]' to column headers, or in a special 'Notes' row.

### How to supply hyperlinks:

You can provide text in Markdown link syntax (e.g. '[GOV.UK](https://www.gov.uk)', adding 'mailto:' before an email address) and the containing cell will be rendered as a hyperlink in the output spreadsheet. Note that whole cells will become hyperlinks; there is no support for selected words in a sentence to be rendered as a hyperlink.

Hyperlinks can be supplied in the character strings to three arguments:

- To the 'tables' argument for sheet type 'cover' only. It's recommended to supply the cover information as a list rather than a data.frame, which will allow you to make specific rows within a section (e.g. 'contact us') into hyperlinks.
- To the 'custom\_rows' argument for sheets of type 'contents', 'notes' and 'tables'.
- To the 'source' argument for sheets of type 'table' only.

## Value

An object with classes 'aftable', 'tbl' and 'data.frame'.

## Examples

```
# Prepare some demo tables of information

set.seed(1066)

cover_list <- list(
  "Section 1" = c("First row of Section 1.", "Second row of Section 1."),
  "Section 2" = "The only row of Section 2.",
  "Section 3" = c(
    "[Website](https://best-practice-and-impact.github.io/aftables/)",
    "[Email address](mailto:fake.address@aftables.com)"
  )
)
```

```

contents_df <- data.frame(
  "Sheet name" = c("Notes", "Table_1", "Table_2"),
  "Sheet title" = c(
    "Notes used in this workbook",
    "First Example Sheet",
    "Second Example Sheet"
  ),
  check.names = FALSE
)

notes_df <- data.frame(
  "Note number" = paste0("[note ", 1:2, "]"),
  "Note text" = c("First note.", "Second note."),
  check.names = FALSE
)

table_1_df <- data.frame(
  Category = LETTERS[1:10],
  "Numeric [note 1]" = 1:10,
  "Numeric suppressed" = c(1:4, "[c]", 6:9, "[x]"),
  "Numeric thousands" = abs(round(rnorm(10), 4) * 1e5),
  "Numeric decimal" = abs(round(rnorm(10), 5)),
  "Long name that means that the column width needs to be widened" = 1:10,
  Notes = c(
    "[note 1]", rep(NA_character_, 4), "[note 2]",
    rep(NA_character_, 4)
  ),
  check.names = FALSE
)

table_2_df <- data.frame(Category = LETTERS[1:10], Numeric = 1:10)

# Create 'aftables' object
x <- aftables::create_aftable(
  tab_titles = c("Cover", "Contents", "Notes", "Table_1", "Table_2"),
  sheet_types = c("cover", "contents", "notes", "tables", "tables"),
  sheet_titles = c(
    "The 'aftables' Demo Workbook",
    "Table of contents",
    "Notes",
    "Table 1: First Example Sheet",
    "Table 2: Second Example Sheet"
  ),
  blank_cells = c(
    rep(NA_character_, 3),
    "Blank cells indicate that there's no note in that row.",
    NA_character_
  ),
  custom_rows = list(
    NA_character_,

```

```

    NA_character_,
    "A custom row.",
    c(
      paste0(
        "First custom row [with a hyperlink.]",
        "(https://best-practice-and-impact.github.io/aftables/)"
      ),
      "Second custom row."
    ),
    "A custom row."
  ),
  sources = c(
    rep(NA_character_, 3),
    paste0(
      "[The Source Material, 2024.]",
      "(https://best-practice-and-impact.github.io/aftables/)"
    ),
    "The Source Material, 2024."
  ),
  tables = list(cover_list, contents_df, notes_df, table_1_df, table_2_df)
)

# Test that 'aftable' is one of the object's classes
is_aftable(x)

# Look at the structure of the object
str(x, max.level = 2)

```

---

create\_config\_yaml      *Create an aftables config.yaml*

---

## Description

Copy the example config.yaml file included with aftables to a directory of the user's choice, and optionally open the file for editing. The config.yaml file can be passed to the aftables function [generate\\_workbook](#).

## Usage

```
create_config_yaml(path = getwd(), open_config = rlang::is_interactive())
```

## Arguments

path	optional character string containing directory to copy the config.yaml file. Defaults to current working directory.
open_config	optional logical whether to open the copy of config.yaml for editing in the current R session.

## Details

If there is an existing config.yaml file in the destination directory this function will not overwrite it.

Contents of example config.yaml:

```
aftables:
  default:
    workbook_properties:
      author: "aftables"
      title: "aftables example workbook"
      keywords:
        - "aftables1"
        - "aftables2"
        - "aftables3"
      subject: "aftables example subject"
      category: "aftables example category"
      comments: "aftables example comments"
    workbook_format:
      base_font_name: "Arial"
      base_font_size: 12
      table_header_size: 12
      sheet_heading_size: 16
      sheet_subheading_size: 14
      cellwidth_default: 16
      cellwidth_wider: 32
      nchar_break: 50
    workbook1:
      workbook_properties:
        category: "aftables workbook 1 category"
        keywords:
          - "aftablesworkbook1"
    workbook2:
      workbook_properties:
        title: "aftables workbook 2"
        category: "aftables workbook 2 category"
        keywords:
          - "aftablesworkbook2"
```

All configurations must be placed below an aftables key. aftables should be followed by a default key and/or custom keys (e.g. workbook1).

The default key settings will be read by all calls to [generate\\_workbook](#) which use this config.yml. This allows you to share settings when generating multiple workbooks in one script.

Custom key settings (e.g. workbook1) will only be used by [generate\\_workbook](#) when the key is provided as the config\_name argument. This allows you to specify settings for a specific workbook. Custom key settings will be preferred over the default settings.

Keys below workbook\_properties will appear in the Excel workbook when it is saved using [wb\\_save](#) from openxlsx2. They can be found in the file properties or the workbook information.

Keys below `workbook_format` will be applied to the contents of the workbook. The values of `base_font_name` and `base_font_size` define the default font name and size used by the workbook. All text not formatted as a table header, sheet subheading or sheet heading will use the default settings. Font sizes of sheet headings, sheet subheadings, and table header rows will use the values of `sheet_heading_size`, `sheet_subheading_size` and `table_header_size` respectively, and they will additionally be formatted as bold.

The values of `cellwidth_default`, `cellwidth_wider` and `nchar_break` are used to define column widths. The units of `cellwidth_default` and `cellwidth_wider` are the column width values used by Excel. All columns widths are set by default to use the `cellwidth_default` value. If the number of characters in a column header or the contents of a column exceeds the value of `nchar_break` `aftables` will set the column width to the value of `cellwidth_wider`. Users can avoid text wrapping in columns or column headers by setting the value of `nchar_break` based on their data or the content of their column headers.

Not all workbook configuration options need to be set. Required settings are documented in [generate\\_workbook](#).

## Examples

```
# Use default arguments to copy `aftables` `config.yaml` file to the current
# working directory without opening the copied file for editing:

## Not run:
create_config_yaml(open_config = FALSE)
## End(Not run)
```

---

demo_aftable	<i>A Demo 'aftables' Object</i>
--------------	---------------------------------

---

## Description

A pre-created 'aftables' object ready to be converted to an 'openxlsx2' `wbWorkbook`-class object with [generate\\_workbook](#).

## Usage

```
demo_aftable
```

## Format

A `data.frame` with 6 rows and 7 columns:

**tab\_title** Character. Text to appear on each sheet's tab.

**sheet\_type** Character. The content type for each sheet: 'cover', 'contents', 'notes', or 'tables'.

**sheet\_title** Character. The title that will appear in cell A1 (top-left) of each sheet.

**blank\_cells** Character. An explanation for any blank cells in the table.

**custom\_rows** List-column of character vectors. Additional arbitrary pre-table information provided by the user.

**source** Character. The origin of the data, if relevant.

**table** List-column of data.frames (apart from the cover, which is a list) containing the statistical tables.

---

demo\_df

*A Demo 'data.frame' Object*

---

### Description

A pre-created data.frame ready to be converted to an atables-class object with [as\\_atable](#) and then an 'openxlsx2' wbWorkbook-class object with [generate\\_workbook](#).

### Usage

demo\_df

### Format

A data.frame with 6 rows and 7 columns:

**tab\_title** Character. Text to appear on each sheet's tab.

**sheet\_type** Character. The content type for each sheet: 'cover', 'contents', 'notes', or 'tables'.

**sheet\_title** Character. The title that will appear in cell A1 (top-left) of each sheet.

**blank\_cells** Character. An explanation for any blank cells in the table.

**custom\_rows** List-column of character vectors. Additional arbitrary pre-table information provided by the user.

**source** Character. The origin of the data, if relevant.

**table** List-column of data.frames (apart from the cover, which is a list) containing the statistical tables.

---

demo\_workbook

*A Demo 'Workbook' Object*

---

### Description

A pre-created 'openxlsx2' wbWorkbook-class object generated from an atables-class object with [generate\\_workbook](#).

### Usage

demo\_workbook

### Format

An 'openxlsx2' wbWorkbook-class object with 5 sheets.

---

generate_workbook	<i>Generate A Workbook Object From An 'aftable'</i>
-------------------	---

---

### Description

Populate an 'openxlsx2' wbWorkbook-class object with content from an aftable-class object. In turn, the output can be passed to [wb\\_save](#) from 'openxlsx2'

### Usage

```
generate_workbook(  
  aftable,  
  author = NULL,  
  title = NULL,  
  keywords = NULL,  
  config_path = "config.yaml",  
  config_name = NULL  
)
```

### Arguments

aftable	An aftable-class object created using <a href="#">create_aftable</a> (or <a href="#">as_aftable</a> ), which contains the data and information needed to create a workbook.
author	Optional character string to set the workbook author. Default NULL.
title	Optional character string to set the workbook title. Default NULL.
keywords	Optional character vector to set the workbook keywords. Default NULL.
config_path	Optional character string containing path to config file. Defaults to config.yaml file located in working directory.
config_name	Optional character string specifying which configuration to use from config file. Default NULL.

### Details

Analysis Function guidance advises workbooks should have the author, title, keywords and language document properties completed. aftables provides functionality to set the author, title and keywords properties. See [Releasing statistics in spreadsheets](#) for more information including how to set the workbook language.

A config file can be used to set workbook properties and formatting. See [create\\_config\\_yaml](#) for details of how to create a config.yaml file. If author, title or keywords are provided in both the config.yaml file and in the generate\_workbook arguments, the values provided in the function arguments are preferred to those provided in the config.yaml file.

### Value

An openxlsx2 wbWorkbook-class object.

**Examples**

```

# Convert an aftable to an openxlsx2 wbWorkbook-class object
# Setting the minimum workbook properties as function arguments
## Not run:
example_workbook <- generate_workbook(
  demo_aftable,
  author = "Example author",
  title = "example workbook",
  keywords = c("keyword1", "keyword2", "keyword3")
)
## End(Not run)

# Use openxlsx2::wb_get_properties to view properties that have been applied
## Not run:
openxlsx2::wb_get_properties(example_workbook)
## End(Not run)

# Save the workbook with openxlsx2::wb_save
## Not run:
openxlsx2::wb_save(example_workbook, "example_workbook.xlsx")
## End(Not run)

# Using config.yaml file to set workbook properties and edit text and cell
# formatting
## Not run:
example_workbook2 <- generate_workbook(
  demo_aftable,
  config_path = system.file("ext-data", "config.yaml", package = "aftables"),
  config_name = "workbook1"
)
## End(Not run)

# Use openxlsx2::wb_get_properties to view properties that have been applied
## Not run:
openxlsx2::wb_get_properties(example_workbook2)
## End(Not run)

```

---

summary.aftable

*Summarise An 'aftable' Object*

---

**Description**

A concise result summary of an aftable-class object to see information about the sheet content. Shows a numbered list of sheets with each tab title, sheet type and table dimensions.

**Usage**

```

## S3 method for class 'aftable'
summary(object, ...)

```

**Arguments**

object            An aftable-class object for which to get a summary.  
 ...              Other arguments to pass.

**Value**

object unaltered.

**Examples**

```
# Print a concise summary of the aftable-class object
summary(demo_aftable)

# Alternatively, look at the structure
str(demo_aftable, max.level = 2)
```

---

tbl_sum.aftable	<i>Provide A Succinct Summary Of An 'aftable' Object</i>
-----------------	--

---

**Description**

A brief text description of an aftable-class object.

**Usage**

```
## S3 method for class 'aftable'
tbl_sum(x, ...)
```

**Arguments**

x                An aftable-class object to summarise.  
 ...              Other arguments to pass.

**Value**

Named character vector.

**Examples**

```
# Print with description
print(demo_aftable)

# Print description only (package 'tibble' must be installed)
tibble::tbl_sum(demo_aftable)
```
