

Package ‘autostats’

May 7, 2026

Type Package

Title Auto Stats

Version 0.4.2

Maintainer Harrison Tietze <harrison4192@gmail.com>

Description Automatically do statistical exploration. Create formulas using 'tidyselect' syntax, and then determine cross-validated model accuracy and variable contributions using 'glm' and 'xgboost'. Contains additional helper functions to create and modify formulas. Has a flagship function to quickly determine relationships between categorical and continuous variables in the data set.

Encoding UTF-8

Imports dplyr, stringr, tidyselect, purrr, janitor, tibble, rlang, stats, rlist, broom, magrittr, ggeasy, ggplot2, jtools, gtools, ggthemes, patchwork, tidyr, xgboost, parsnip, recipes, rsample, tune, workflows, framecleaner, presenter, yardstick, dials, party, data.table, nnet, recosystem, Ckmeans.1d.dp, broom.mixed, igraph

RoxygenNote 7.3.3

auto_anova	<i>auto anova</i>
------------	-------------------

Description

A wrapper around `lm` and `anova` to run a regression of a continuous variable against categorical variables. Used for determining the whether the mean of a continuous variable is statistically significant amongst different levels of a categorical variable.

Usage

```
auto_anova(
  data,
  ...,
  baseline = c("mean", "median", "first_level", "user_supplied"),
  user_supplied_baseline = NULL,
  sparse = FALSE,
  pval_thresh = 0.1
)
```

Arguments

data	a data frame
...	tidyselect specification or cols
baseline	choose from "mean", "median", "first_level", "user_supplied". what is the baseline to compare each category to? can use the mean and median of the target variable as a global baseline
user_supplied_baseline	if intercept is "user_supplied", can enter a numeric value
sparse	default FALSE; if true returns a truncated output with only significant results
pval_thresh	control significance level for sparse output filtering

Details

Columns can be inputted as unquoted names or tidyselect. Continuous and categorical variables are automatically determined. If no character or factor column is present, the column with the lowest amount of unique values will be considered the categorical variable.

Description of columns in the output

target continuous variables

predictor categorical variables

level levels in the categorical variables

estimate difference between level target mean and baseline

target_mean target mean per level

n rows in predictor level

std.error standard error of target in predictor level

level_p.value p.value for t.test of whether target mean differs significantly between level and baseline

level_significance level p.value represented by stars

predictor_p.value p.value for significance of entire predictor given by F test

predictor_significance predictor p.value represented by stars

conclusion text interpretation of tests

Value

data frame

Examples

```
iris %>%
  auto_anova(tidyselect::everything()) -> iris_anova1
```

```
iris_anova1 %>%
  print(width = Inf)
```

auto_boxplot	<i>auto_boxplot</i>
--------------	---------------------

Description

Wraps `geom_boxplot` to simplify creating boxplots.

Usage

```
auto_boxplot(  
  .data,  
  continuous_outcome,  
  categorical_variable,  
  categorical_facets = NULL,  
  alpha = 0.3,  
  width = 0.15,  
  color_dots = "black",  
  color_box = "red"  
)
```

Arguments

<code>.data</code>	data
<code>continuous_outcome</code>	continuous y variable. unquoted column name
<code>categorical_variable</code>	categorical x variable. unquoted column name
<code>categorical_facets</code>	categorical facet variable. unquoted column name
<code>alpha</code>	alpha points
<code>width</code>	width of jitter
<code>color_dots</code>	dot color
<code>color_box</code>	box color

Value

ggplot

Examples

```
iris %>%  
  auto_boxplot(continuous_outcome = Petal.Width, categorical_variable = Species)
```

auto_cor	<i>auto correlation</i>
----------	-------------------------

Description

Finds the correlation between numeric variables in a data frame, chosen using `tidyselect`. Additional parameters for the correlation test can be specified as in [cor.test](#)

Usage

```
auto_cor(  
  .data,  
  ...,  
  use = c("pairwise.complete.obs", "all.obs", "complete.obs", "everything",  
         "na.or.complete"),  
  method = c("pearson", "kendall", "spearman", "xicor"),  
  include_nominals = TRUE,  
  max_levels = 5L,  
  sparse = TRUE,  
  pval_thresh = 0.1  
)
```

Arguments

<code>.data</code>	data frame
<code>...</code>	<code>tidyselect</code> cols
<code>use</code>	method to deal with na. Default is to remove rows with NA
<code>method</code>	correlation method. default is pearson, but also supports <code>xicor</code> .
<code>include_nominals</code>	logicals, default TRUE. Dummify nominal variables?
<code>max_levels</code>	maximum numbers of dummies to be created from nominal variables
<code>sparse</code>	logical, default TRUE. Filters and arranges cor table
<code>pval_thresh</code>	threshold to filter out weak correlations

Details

includes the asymmetric correlation coefficient ξ from [xicor](#)

Value

data frame of correlations

Examples

```
iris %>%
  auto_cor()

# don't use sparse if you're interested in only one target variable
iris %>%
  auto_cor(sparse = FALSE) %>%
  dplyr::filter(x == "Petal.Length")
```

auto_model_accuracy *auto model accuracy*

Description

Runs a cross validated xgboost and regularized linear regression, and reports accuracy metrics. Automatically determines whether the provided formula is a regression or classification.

Usage

```
auto_model_accuracy(
  data,
  formula,
  ...,
  n_folds = 4,
  as_flextable = TRUE,
  include_linear = FALSE,
  theme = "tron",
  seed = 1,
  mtry = 1,
  trees = 15L,
  min_n = 1L,
  tree_depth = 6L,
  learn_rate = 0.3,
  loss_reduction = 0,
  sample_size = 1,
  stop_iter = 10L,
  counts = FALSE,
  penalty = 0.015,
  mixture = 0.35
)
```

Arguments

data	data frame
formula	formula
...	any other params for xgboost

n_folds	number of cross validation folds
as_flextable	if FALSE, returns a tibble
include_linear	if TRUE includes a regularized linear model
theme	make_flextable theme
seed	seed
mtry	# Randomly Selected Predictors; defaults to .75; (xgboost: colsample_bynode) (type: numeric, range 0 - 1) (or type: integer if count = TRUE)
trees	# Trees (xgboost: nrounds) (type: integer, default: 500L)
min_n	Minimal Node Size (xgboost: min_child_weight) (type: integer, default: 2L); [typical range: 2-10] Keep small value for highly imbalanced class data where leaf nodes can have smaller size groups. Otherwise increase size to prevent overfitting outliers.
tree_depth	Tree Depth (xgboost: max_depth) (type: integer, default: 7L); Typical values: 3-10
learn_rate	Learning Rate (xgboost: eta) (type: double, default: 0.05); Typical values: 0.01-0.3
loss_reduction	Minimum Loss Reduction (xgboost: gamma) (type: double, default: 1.0); range: 0 to Inf; typical value: 0 - 20 assuming low-mid tree depth
sample_size	Proportion Observations Sampled (xgboost: subsample) (type: double, default: .75); Typical values: 0.5 - 1
stop_iter	# Iterations Before Stopping (xgboost: early_stop) (type: integer, default: 15L) only enabled if validation set is provided
counts	if TRUE specify mtry as an integer number of cols. Default FALSE to specify mtry as fraction of cols from 0 to 1
penalty	linear regularization parameter
mixture	linear model parameter, combines l1 and l2 regularization

Value

a table

auto_tune_xgboost	<i>auto_tune_xgboost</i>
-------------------	--------------------------

Description

Automatically tunes an xgboost model using grid or bayesian optimization

Usage

```

auto_tune_xgboost(
  .data,
  formula,
  tune_method = c("grid", "bayes"),
  event_level = c("first", "second"),
  n_fold = 5L,
  n_iter = 100L,
  seed = 1,
  save_output = FALSE,
  parallel = TRUE,
  trees = tune::tune(),
  min_n = tune::tune(),
  mtry = tune::tune(),
  tree_depth = tune::tune(),
  learn_rate = tune::tune(),
  loss_reduction = tune::tune(),
  sample_size = tune::tune(),
  stop_iter = tune::tune(),
  counts = FALSE,
  tree_method = c("auto", "exact", "approx", "hist", "gpu_hist"),
  monotone_constraints = 0L,
  num_parallel_tree = 1L,
  lambda = 1,
  alpha = 0,
  scale_pos_weight = 1,
  verbosity = 0L
)

```

Arguments

.data	dataframe
formula	formula
tune_method	method of tuning. defaults to grid
event_level	for binary classification, which factor level is the positive class. specify "second" for second level
n_fold	integer. n folds in resamples
n_iter	n iterations for tuning (bayes); paramter grid size (grid)
seed	seed
save_output	FALSE. If set to TRUE will write the output as an rds file
parallel	default TRUE; If set to TRUE, will enable parallel processing on resamples for grid tuning
trees	# Trees (xgboost: nrounds) (type: integer, default: 500L)
min_n	Minimal Node Size (xgboost: min_child_weight) (type: integer, default: 2L); [typical range: 2-10] Keep small value for highly imbalanced class data where

	leaf nodes can have smaller size groups. Otherwise increase size to prevent overfitting outliers.
mtry	# Randomly Selected Predictors; defaults to .75; (xgboost: colsample_bynode) (type: numeric, range 0 - 1) (or type: integer if count = TRUE)
tree_depth	Tree Depth (xgboost: max_depth) (type: integer, default: 7L); Typical values: 3-10
learn_rate	Learning Rate (xgboost: eta) (type: double, default: 0.05); Typical values: 0.01-0.3
loss_reduction	Minimum Loss Reduction (xgboost: gamma) (type: double, default: 1.0); range: 0 to Inf; typical value: 0 - 20 assuming low-mid tree depth
sample_size	Proportion Observations Sampled (xgboost: subsample) (type: double, default: .75); Typical values: 0.5 - 1
stop_iter	# Iterations Before Stopping (xgboost: early_stop) (type: integer, default: 15L) only enabled if validation set is provided
counts	if TRUE specify mtry as an integer number of cols. Default FALSE to specify mtry as fraction of cols from 0 to 1
tree_method	xgboost tree_method. default is auto. reference: tree method docs
monotone_constraints	an integer vector with length of the predictor cols, of -1, 1, 0 corresponding to decreasing, increasing, and no constraint respectively for the index of the predictor col. reference: monotonicity docs .
num_parallel_tree	should be set to the size of the forest being trained. default 1L
lambda	[default=.5] L2 regularization term on weights. Increasing this value will make model more conservative.
alpha	[default=.1] L1 regularization term on weights. Increasing this value will make model more conservative.
scale_pos_weight	[default=1] Control the balance of positive and negative weights, useful for unbalanced classes. if set to TRUE, calculates sum(negative instances) / sum(positive instances). If first level is majority class, use values < 1, otherwise normally values >1 are used to balance the class distribution.
verbosity	[default=1] Verbosity of printing messages. Valid values are 0 (silent), 1 (warning), 2 (info), 3 (debug).

Details

Default is to tune all 7 xgboost parameters. Individual parameter values can be optionally fixed to reduce tuning complexity.

Value

workflow object

Examples

```
iris %>%
  framecleaner::create_dummies() -> iris1

iris1 %>%
  tidy_formula(target = Petal.Length) -> petal_form

iris1 %>%
  rsample::initial_split() -> iris_split

iris_split %>%
  rsample::analysis() -> iris_train

iris_split %>%
  rsample::assessment() -> iris_val

## Not run:
iris_train %>%
  auto_tune_xgboost(formula = petal_form, n_iter = 10,
    parallel = FALSE, tune_method = "grid", mtry = .5) -> xgb_tuned

xgb_tuned %>%
  parsnip::fit(iris_train) %>%
  parsnip::extract_fit_engine() -> xgb_tuned_fit

xgb_tuned_fit %>%
  tidy_predict(newdata = iris_val, form = petal_form) -> iris_val1

## End(Not run)
```

auto_t_test

auto t test

Description

Performs a t.test on 2 populations for numeric variables.

Usage

```
auto_t_test(data, col, ..., var_equal = FALSE, abbrev = TRUE)
```

Arguments

data dataframe

col	a column with 2 categories representing the 2 populations
...	numeric variables to perform t.test on. Default is to select all numeric variables
var_equal	default FALSE; t.test parameter
abbrv	default TRUE; remove some extra columns from output

Value

dataframe

Examples

```
iris %>%  
  dplyr::filter(Species != "setosa") %>%  
  auto_t_test(col = Species)
```

auto_variable_contributions

Plot Variable Contributions

Description

Return a variable importance plot and coefficient plot from a linear model. Used to easily visualize the contributions of explanatory variables in a supervised model

Usage

```
auto_variable_contributions(data, formula, scale = TRUE)
```

Arguments

data	dataframe
formula	formula
scale	logical. If FALSE puts coefficients on original scale

Value

a ggplot object

Examples

```
iris %>%  
  framecleaner::create_dummies() %>%  
  auto_variable_contributions(  
    tidy_formula(., target = Petal.Width)  
  )
```

```
iris %>%  
  auto_variable_contributions(  
    tidy_formula(., target = Species)  
  )
```

cap_outliers

cap_outliers

Description

Caps the outliers of a numeric vector by percentiles. Also outputs a plot of the capped distribution

Usage

```
cap_outliers(x, q = 0.05, type = c("both", "upper", "lower"))
```

Arguments

x	numeric vector
q	decimal input to the quantile function to set cap. default .05 caps at the 95 and 5th percentile
type	chr vector. where to cap: both, upper, or lower

Value

numeric vector

Examples

```
cap_outliers(iris$Petal.Width)
```

eval_preds	<i>eval_preds</i>
------------	-------------------

Description

Automatically evaluates predictions created by `tidy_predict`. No need to supply column names.

Usage

```
eval_preds(.data, ..., softprob_model = NULL)
```

Arguments

<code>.data</code>	dataframe as a result of <code>tidy_predict</code>
<code>...</code>	additional metrics from <code>yarstick</code> to be calculated
<code>softprob_model</code>	character name of the model used to create multiclass probabilities

Value

tibble of summarized metrics

f_charvec_to_formula	<i>charvec to formula</i>
----------------------	---------------------------

Description

takes the lhs and rhs of a formula as character vectors and outputs a formula

Usage

```
f_charvec_to_formula(lhs, rhs)
```

Arguments

<code>lhs</code>	lhs atomic chr vec
<code>rhs</code>	rhs chr vec

Value

formula

Examples

```
lhs <- "Species"
rhs <- c("Petal.Width", "Custom_Var")

f_charvec_to_formula(lhs, rhs)
```

f_formula_to_charvec *Formula_rhs to chr vec*

Description

Accepts a formula and returns the rhs as a character vector.

Usage

```
f_formula_to_charvec(f, include_lhs = FALSE, .data = NULL)
```

Arguments

f	formula
include_lhs	FALSE. If TRUE, appends lhs to beginning of vector
.data	dataframe for names if necessary

Value

chr vector

Examples

```
iris %>%  
tidy_formula(target = Species, tidyselect::everything()) -> f  
  
f  
  
f %>%  
f_formula_to_charvec()
```

f_modify_formula *Modify Formula*

Description

Modify components of a formula by adding / removing vars from the rhs or replacing the lhs.

Usage

```
f_modify_formula(  
  f,  
  rhs_remove = NULL,  
  rhs_add = NULL,  
  lhs_replace = NULL,  
  negate = TRUE  
)
```

Arguments

f	formula
rhs_remove	regex or character vector for dropping variables from the rhs
rhs_add	character vector for adding variables to rhs
lhs_replace	string to replace formula lhs if supplied
negate	should rhs_remove keep or remove the specified vars. Set to FALSE to keep

Value

formula

Examples

```
iris %>%
tidy_formula(target = Species, tidyselect::everything()) -> f

f

f %>%
  f_modify_formula(
    rhs_remove = c("Petal.Width", "Sepal.Length"),
    rhs_add = "Custom_Variable"
  )

f %>%
  f_modify_formula(
    rhs_remove = "Petal",
    lhs_replace = "Petal.Length"
  )
```

impute_recosystem *impute_recosystem*

Description

Imputes missing values of a numeric matrix using stochastic gradient descent. **recosystem**

Usage

```
impute_recosystem(
  .data,
  lrate = c(0.05, 0.1),
  costp_l1 = c(0, 0.05),
  costq_l1 = c(0, 0.05),
  costp_l2 = c(0, 0.05),
  costq_l2 = c(0, 0.05),
  nthread = 8,
```

```

    loss = "l2",
    niter = 15,
    verbose = FALSE,
    nfold = 4,
    seed = 1
  )

```

Arguments

<code>.data</code>	long format data frame
<code>lrate</code>	learning rate
<code>costp_l1</code>	l1 cost p
<code>costq_l1</code>	l1 cost q
<code>costp_l2</code>	l2 cost p
<code>costq_l2</code>	l2 cost q
<code>nthread</code>	nthreads
<code>loss</code>	loss function. also can use "l1"
<code>niter</code>	training iterations for tune
<code>verbose</code>	show training loss?
<code>nfold</code>	folds for tune validation
<code>seed</code>	seed for randomness

Details

input is a long data frame with 3 columns: ID col, Item col (the column names from pivoting longer), and the ratings (values from pivoting longer)

pre-processing generally requires pivoting a wide user x item matrix to long format. The missing values from the matrix must be retained as NA values in the rating column. The values will be predicted and filled in by the algorithm. Output is a long data frame with the same number of rows as input, but no missing values.

This function automatically tunes the recosystem learner before applying. Parameter values can be supplied for tuning. To avoid tuning, use single values for the parameters.

Value

long format data frame

tidy_cforest	<i>tidy conditional inference forest</i>
--------------	--

Description

Runs a conditional inference forest.

Usage

```
tidy_cforest(data, formula, seed = 1)
```

Arguments

data	dataframe
formula	formula
seed	seed integer

Value

a cforest model

Examples

```
iris %>%
  tidy_cforest(
    tidy_formula(., Petal.Width)
  ) -> iris_cfor

iris_cfor

iris_cfor %>%
  visualize_model()
```

tidy_ctree	<i>tidy ctree</i>
------------	-------------------

Description

tidy conditional inference tree. Creates easily interpretable decision tree models that be shown with the [visualize_model](#) function. Statistical significance required for a split , and minimum necessary samples in a terminal leaf can be controlled to create the desired tree visual.

Usage

```
tidy_ctree(.data, formula, minbucket = 7L, mincriterion = 0.95, ...)
```

Arguments

.data	dataframe
formula	formula
minbucket	minimum amount of samples in terminal leaves, default is 7
mincriterion	(1 - alpha) value between 0 -1, default is .95. lowering this value creates more splits, but less significant
...	optional parameters to ctree_control

Value

a ctree object

Examples

```
iris %>%
tidy_formula(., Sepal.Length) -> sepal_form
```

```
iris %>%
tidy_ctree(sepal_form) %>%
visualize_model()
```

```
iris %>%
tidy_ctree(sepal_form, minbucket = 30) %>%
visualize_model(plot_type = "box")
```

tidy_formula	<i>tidy formula construction</i>
--------------	----------------------------------

Description

Takes a dataframe and allows for use of tidyselct to construct a formula.

Usage

```
tidy_formula(data, target, ...)
```

Arguments

data	dataframe
target	lhs
...	tidyselct. rhs

Value

a formula

Examples

```
iris %>%  
tidy_formula(Species, tidyselect::everything())
```

tidy_glm

tidy glm

Description

Runs either a linear regression, logistic regression, or multinomial classification. The model is automatically determined based off the nature of the target variable.

Usage

```
tidy_glm(data, formula)
```

Arguments

data	dataframe
formula	formula

Value

glm model

Examples

```
# linear regression  
iris %>%  
tidy_glm(  
tidy_formula(., target = Petal.Width)) -> glm1  
  
glm1  
  
glm1 %>%  
visualize_model()  
  
# multinomial classification  
  
tidy_formula(iris, target = Species) -> species_form  
  
iris %>%  
tidy_glm(species_form) -> glm2  
  
glm2 %>%  
visualize_model()  
  
# logistic regression
```

```
iris %>%
  dplyr::filter(Species != "setosa") %>%
  tidy_glm(species_form) -> glm3

suppressWarnings({
  glm3 %>%
  visualize_model()})
```

tidy_predict

tidy predict

Description

tidy predict

Usage

```
tidy_predict(
  model,
  newdata,
  form = NULL,
  olddata = NULL,
  bind_preds = FALSE,
  ...
)

## S3 method for class 'Rcpp_ENSEMBLE'
tidy_predict(model, newdata, form = NULL, ...)

## S3 method for class 'glm'
tidy_predict(model, newdata, form = NULL, ...)

## Default S3 method:
tidy_predict(model, newdata, form = NULL, ...)

## S3 method for class 'BinaryTree'
tidy_predict(model, newdata, form = NULL, ...)

## S3 method for class 'xgb.Booster'
tidy_predict(
  model,
  newdata,
  form = NULL,
  olddata = NULL,
  bind_preds = FALSE,
  ...
)
```

```
## S3 method for class 'lgb.Booster'  
tidy_predict(  
  model,  
  newdata,  
  form = NULL,  
  olddata = NULL,  
  bind_preds = FALSE,  
  ...  
)
```

Arguments

model	model
newdata	dataframe
form	the formula used for the model
olddata	training data set
bind_preds	set to TRUE if newdata is a dataset without any labels, to bind the new and old data with the predictions under the original target name
...	other parameters to pass to predict

Value

dataframe

Examples

```
iris %>%  
  framecleaner::create_dummies(Species) -> iris_dummy  
  
iris_dummy %>%  
  tidy_formula(target= Petal.Length) -> petal_form  
  
iris_dummy %>%  
  tidy_xgboost(  
    petal_form,  
    trees = 20,  
    mtry = .5  
  ) -> xg1  
  
xg1 %>%  
  tidy_predict(newdata = iris_dummy, form = petal_form) %>%  
  head()
```

tidy_shap	<i>tidy shap</i>
-----------	------------------

Description

plot and summarize shapley values from an xgboost model

Usage

```
tidy_shap(model, newdata, form = NULL, ..., top_n = 12, aggregate = NULL)
```

Arguments

model	xgboost model
newdata	dataframe similar to model input
form	formula used for model
...	additional parameters for shapley value
top_n	top n features
aggregate	a character vector. Predictors containing the string will be aggregated, and re-named to that string.

Details

returns a list with the following entries

shap_tbl : table of shaply values

shaps_long : long table of feature and shaply values

shap_summary : table summarizing shapley values. Includes correlation between shaps and feature values.

swarmplot : one plot showing the relation between shaps and features

scatterplots : returns the top 9 most important features as determined by sum of absolute shapley values, as a faceted scatterplot of feature vs shap

Value

list

tidy_xgboost	<i>tidy_xgboost</i>
--------------	---------------------

Description

Accepts a formula to run an xgboost model. Automatically determines whether the formula is for classification or regression. Returns the xgboost model.

Usage

```
tidy_xgboost(
  .data,
  formula,
  ...,
  mtry = 0.75,
  trees = 500L,
  min_n = 2L,
  tree_depth = 7L,
  learn_rate = 0.05,
  loss_reduction = 1,
  sample_size = 0.75,
  stop_iter = 15L,
  counts = FALSE,
  tree_method = c("auto", "exact", "approx", "hist", "gpu_hist"),
  monotone_constraints = 0L,
  num_parallel_tree = 1L,
  lambda = 0.5,
  alpha = 0.1,
  scale_pos_weight = 1,
  verbosity = 0L,
  validate = TRUE,
  booster = c("gbtree", "gblinear")
)
```

Arguments

.data	dataframe
formula	formula
...	additional parameters to be passed to set_engine
mtry	# Randomly Selected Predictors; defaults to .75; (xgboost: colsample_bynode) (type: numeric, range 0 - 1) (or type: integer if count = TRUE)
trees	# Trees (xgboost: nrounds) (type: integer, default: 500L)
min_n	Minimal Node Size (xgboost: min_child_weight) (type: integer, default: 2L); [typical range: 2-10] Keep small value for highly imbalanced class data where leaf nodes can have smaller size groups. Otherwise increase size to prevent overfitting outliers.

tree_depth	Tree Depth (xgboost: max_depth) (type: integer, default: 7L); Typical values: 3-10
learn_rate	Learning Rate (xgboost: eta) (type: double, default: 0.05); Typical values: 0.01-0.3
loss_reduction	Minimum Loss Reduction (xgboost: gamma) (type: double, default: 1.0); range: 0 to Inf; typical value: 0 - 20 assuming low-mid tree depth
sample_size	Proportion Observations Sampled (xgboost: subsample) (type: double, default: .75); Typical values: 0.5 - 1
stop_iter	# Iterations Before Stopping (xgboost: early_stop) (type: integer, default: 15L) only enabled if validation set is provided
counts	if TRUE specify mtry as an integer number of cols. Default FALSE to specify mtry as fraction of cols from 0 to 1
tree_method	xgboost tree_method. default is auto. reference: tree method docs
monotone_constraints	an integer vector with length of the predictor cols, of -1, 1, 0 corresponding to decreasing, increasing, and no constraint respectively for the index of the predictor col. reference: monotonicity docs .
num_parallel_tree	should be set to the size of the forest being trained. default 1L
lambda	[default=.5] L2 regularization term on weights. Increasing this value will make model more conservative.
alpha	[default=.1] L1 regularization term on weights. Increasing this value will make model more conservative.
scale_pos_weight	[default=1] Control the balance of positive and negative weights, useful for unbalanced classes. if set to TRUE, calculates $\text{sum}(\text{negative instances}) / \text{sum}(\text{positive instances})$. If first level is majority class, use values < 1, otherwise normally values >1 are used to balance the class distribution.
verbosity	[default=1] Verbosity of printing messages. Valid values are 0 (silent), 1 (warning), 2 (info), 3 (debug).
validate	default TRUE. report accuracy metrics on a validation set.
booster	defaults to 'gbtree' for tree boosting but can be set to 'gblinear'

Details

In binary classification the target variable must be a factor with the first level set to the event of interest. A higher probability will predict the first level.

reference for parameters: [xgboost docs](#)

Value

xgb.Booster model

Examples

```
options(rlang_trace_top_env = rlang::current_env())

# regression on numeric variable

iris %>%
  framecleaner::create_dummies(Species) -> iris_dummy

iris_dummy %>%
  tidy_formula(target= Petal.Length) -> petal_form

iris_dummy %>%
  tidy_xgboost(
    petal_form,
    trees = 20,
    mtry = .5
  ) -> xg1

xg1 %>%
  tidy_predict(newdata = iris_dummy, form = petal_form) -> iris_preds

iris_preds %>%
  eval_preds()
```

visualize_model

visualize model

Description

s3 method to automatically visualize the output of of a model object. Additional arguments can be supplied for the original function. Check the corresponding plot function documentation for any custom arguments.

Usage

```
visualize_model(model, ...)
```

S3 method for class 'RandomForest'

```
visualize_model(model, ..., method)
```

S3 method for class 'BinaryTree'

```
visualize_model(model, ..., method)
```

```
## S3 method for class 'glm'  
visualize_model(model, ..., method)  
  
## S3 method for class 'multinom'  
visualize_model(model, ..., method)  
  
## S3 method for class 'xgb.Booster'  
visualize_model(model, top_n = 10L, as_table = FALSE, ..., method)  
  
## Default S3 method:  
visualize_model(model, ..., method)
```

Arguments

model	a model
...	additional arguments
method	choose amongst different visualization methods
top_n	return top n elements
as_table	= false, table or graph,

Value

a plot
