

Package ‘colourvalues’

May 8, 2026

Type Package

Title Assigns Colours to Values

Version 0.3.11

Date 2025-11-29

Description Maps one of the viridis colour palettes, or a user-specified palette to values. Viridis colour maps are created by Stéfan van der Walt and Nathaniel Smith, and were set as the default palette for the 'Python' 'Matplotlib' library <<https://matplotlib.org/>>. Other palettes available in this library have been derived from 'RColorBrewer' <<https://CRAN.R-project.org/package=RColorBrewer>> and 'colorspace' <<https://CRAN.R-project.org/package=colorspace>> packages.

License GPL-3

cm	<i>Cm</i>
----	-----------

Description

Data Frame of the cm palette

Usage

```
cm()
```

colour_palettes	<i>Colour Palettes</i>
-----------------	------------------------

Description

List the available colour palettes.

Usage

```
colour_palettes(colours = NULL)
```

```
color_palettes(colours = NULL)
```

Arguments

colours	vector of source colour palettes to return, one or many of "viridis", "rcolorbrewer", "grdevices", "colorspace" NULL will reutrn all palettes.
---------	---

Details

The palettes available in colourvalues have been derived from those in the libraries

- viridis
- RColorBrewer
- grDevices
- colorspace
- colorRamp

Examples

```
colour_palettes()  
colour_palettes( "viridis" )  
colour_palettes( colours = c("rcolorbrewer","grdevices") )
```

colour_values

Colour Values

Description

maps colours to values, returning a vector of hex strings

Usage

```
colour_values(  
  x,  
  palette = "viridis",  
  alpha = 255,  
  na_colour = "#808080FF",  
  include_alpha = TRUE,  
  summary = FALSE,  
  n_summaries = 0,  
  format = TRUE,  
  digits = 2  
)
```

```
color_values(  
  x,  
  palette = "viridis",  
  alpha = 255,  
  na_colour = "#808080FF",  
  include_alpha = TRUE,  
  summary = FALSE,  
  n_summaries = 0,  
  format = TRUE,
```

```
    digits = 2
  )

## S3 method for class 'character'
colour_values_to_hex(
  x,
  palette,
  alpha,
  na_colour,
  include_alpha,
  summary,
  n_summaries,
  format,
  digits
)

## S3 method for class 'logical'
colour_values_to_hex(
  x,
  palette,
  alpha,
  na_colour,
  include_alpha,
  summary,
  n_summaries,
  format,
  digits
)

## S3 method for class 'factor'
colour_values_to_hex(
  x,
  palette,
  alpha,
  na_colour,
  include_alpha,
  summary,
  n_summaries,
  format,
  digits
)

## S3 method for class 'Date'
colour_values_to_hex(
  x,
  palette,
  alpha,
  na_colour,
```

```
    include_alpha,  
    summary,  
    n_summaries,  
    format,  
    digits  
  )  
  
## S3 method for class 'POSIXct'  
colour_values_to_hex(  
  x,  
  palette,  
  alpha,  
  na_colour,  
  include_alpha,  
  summary,  
  n_summaries,  
  format,  
  digits  
)  
  
## S3 method for class 'POSIXlt'  
colour_values_to_hex(  
  x,  
  palette,  
  alpha,  
  na_colour,  
  include_alpha,  
  summary,  
  n_summaries,  
  format,  
  digits  
)  
  
## Default S3 method:  
colour_values_to_hex(  
  x,  
  palette,  
  alpha,  
  na_colour,  
  include_alpha,  
  summary,  
  n_summaries,  
  format,  
  digits  
)
```

Arguments

x vector of values to map to a colour

palette	colour palette. See details and examples
alpha	optional. Single value in $[0, 255]$ applied to all colours, or a decimal in $[0, 1)$ (to indicate a percentage, noting 1 is excluded), or a vector of numeric values the same length as x . The numeric vector will be scaled into the range $[0, 255]$. If a matrix palette is supplied this argument is ignored.
na_colour	hex string colour to use for NA values in the form #RRGGBBAA.
include_alpha	logical indicating if the returned hex or matrix should include the alpha values. Defaults to TRUE.
summary	logical indicating if a summary of the colours should be returned as well as the full colour mapping. This will be the unique elements of x mapped to the colour.
n_summaries	positive integer. If supplied a summary colour palette will be returned in a list, containing <code>n_summaries</code> equally spaced values of x in the range $[\min(x), \max(x)]$, and their associated colours. If a non-numeric x is used this value is ignored
format	logical indicating if the summary values should be formatted.
digits	number of decimal places to show in the summary

Details

The palette can either be

- String - use `colour_palettes()` to view available palettes
- Matrix - At least 5 rows, and 3 (or 4) columns representing the red, green and blue (and alpha) values

The matrix palette requires 5 rows because the colours are interpolated using a cubic b-spline. This method requires 5 values.

See Also

`colour_values_rgb`

Examples

```
## in-built palettes
colour_values(x = 1:5) ## default is "viridis"
colour_values(x = 1:5, palette = "inferno")
colour_values(x = 1:5, palette = "plasma")
colour_values(x = 1:5, palette = "magma")
colour_values(x = 1:5, palette = "cividis")
colour_values(x = 1:5, palette = "rainbow")

## matrix palette
n <- 100
m <- grDevices::colorRamp(c("red", "green"))( (1:n)/n )
df <- data.frame(a = 10, x = 1:n)
df$col <- colour_values(df$x, palette = m)
barplot(height = df$a, col = df$col, border = NA, space = 0)

## with an alpha column on the palette
```

```

n <- 100
m <- grDevices::colorRamp(c("red", "green"))( (1:n)/n )
m <- cbind(m, seq(0, 255, length.out = 100))
df <- data.frame(a = 10, x = 1:n)
df$col <- colour_values(df$x, palette = m)
barplot(height = df$a, col = df$col, border = NA, space = 0)

## single alpha value for all colours
df <- data.frame(a = 10, x = 1:255)
df$col <- colour_values(df$x, alpha = 50)
barplot(height = df$a, col = df$col, border = NA, space = 0)

## vector of alpha values
df <- data.frame(a = 10, x = 1:300, y = rep(c(1:50, 50:1), 3) )
df$col <- colour_values(df$x, alpha = df$y)
barplot(height = df$a, col = df$col, border = NA, space = 0)

## returning a summary palette
colour_values(-10:10, n_summaries = 5)

colour_values(x = runif(20, 0, 1), n_summaries = 3, digits = 2)
colour_values(x = runif(20, 0, 1), n_summaries = 3, digits = 10)

## Formatting output
## default is TRUE
colour_values(
  x = seq(as.Date("2023-01-01"), as.Date("2023-01-31"), by = 1)
  , n_summaries = 5
)
colour_values(
  x = seq(as.Date("2023-01-01"), as.Date("2023-01-31"), by = 1)
  , n_summaries = 5
  , format = FALSE
)

```

colour_values_rgb

Colour Values RGB

Description

Maps colours to values, returning a matrix of RGB(A) values

Usage

```

colour_values_rgb(
  x,
  palette = "viridis",
  alpha = 255,
  na_colour = "#808080FF",

```

```
    include_alpha = TRUE,
    summary = FALSE,
    n_summaries = 0,
    format = TRUE,
    digits = 2
  )

color_values_rgb(
  x,
  palette = "viridis",
  alpha = 255,
  na_colour = "#808080FF",
  include_alpha = TRUE,
  summary = FALSE,
  n_summaries = 0,
  format = TRUE,
  digits = 2
)

## S3 method for class 'character'
colour_values_to_rgb(
  x,
  palette,
  alpha,
  na_colour,
  include_alpha,
  summary,
  n_summaries,
  format,
  digits
)

## S3 method for class 'logical'
colour_values_to_rgb(
  x,
  palette,
  alpha,
  na_colour,
  include_alpha,
  summary,
  n_summaries,
  format,
  digits
)

## S3 method for class 'factor'
colour_values_to_rgb(
  x,
```

```
palette,
alpha,
na_colour,
include_alpha,
summary,
n_summaries,
format,
digits
)

## S3 method for class 'Date'
colour_values_to_rgb(
  x,
  palette,
  alpha,
  na_colour,
  include_alpha,
  summary,
  n_summaries,
  format,
  digits
)

## S3 method for class 'POSIXct'
colour_values_to_rgb(
  x,
  palette,
  alpha,
  na_colour,
  include_alpha,
  summary,
  n_summaries,
  format,
  digits
)

## S3 method for class 'POSIXlt'
colour_values_to_rgb(
  x,
  palette,
  alpha,
  na_colour,
  include_alpha,
  summary,
  n_summaries,
  format,
  digits
)
```

Arguments

x	vector of values to map to a colour
palette	colour palette. See details and examples
alpha	optional. Single value in $[0, 255]$ applied to all colours, or a decimal in $[0, 1)$ (to indicate a percentage, noting 1 is excluded), or a vector of numeric values the same length as x. The numeric vector will be scaled into the range $[0, 255]$. If a matrix palette is supplied this argument is ignored.
na_colour	hex string colour to use for NA values in the form #RRGGBBAA.
include_alpha	logical indicating if the returned hex or matrix should include the alpha values. Defaults to TRUE.
summary	logical indicating if a summary of the colours should be returned as well as the full colour mapping. This will be the unique elements of x mapped to the colour.
n_summaries	positive integer. If supplied a summary colour palette will be returned in a list, containing n_summaries equally spaced values of x in the range $[\min(x), \max(x)]$, and their associated colours. If a non-numeric x is used this value is ignored
format	logical indicating if the summary values should be formatted.
digits	number of decimal places to show in the summary

Details

The palette can either be

- String - use `colour_palettes()` to view available palettes
- Matrix - At least 5 rows, and 3 (or 4) columns representing the red, green and blue (and alpha) values

The matrix palette requires 5 rows because the colours are interpolated using a cubic b-spline. This method requires 5 values.

`colour_values`

Examples

```
colour_values_rgb(1:5)
colour_values_rgb(1:5, include_alpha = FALSE)
colour_values_rgb(-25:25, n_summaries = 5)
```

convert_colour *Convert Colour*

Description

Converts colours between RRGGBBAA and hex strings, in both directions.

Usage

```
convert_colour(x)
```

```
convert_colours(x)
```

```
convert_color(x)
```

```
convert_colors(x)
```

Arguments

x character vector of hex strings, or numeric matrix of RRGGBBAA values

Details

If a combination of hex strings with and without alpha values are supplied, those without are assumed to have an alpha value of FF and will be returned in the RRGGBBAA matrix

Examples

```
convert_colour(c("#FFAA00"))
convert_colour(c("#FFAA00", "#FF00AFFF"))

convert_colour(matrix(c(255,170,0), ncol = 3))
convert_colour(matrix(c(255,170,0,255), ncol = 4))
```

cyan2yellow *Cyan2yellow*

Description

Data Frame of the cyan2yellow palette

Usage

```
cyan2yellow()
```

diverge_hcl	<i>Diverge_hcl</i>
-------------	--------------------

Description

Data Frame of the diverge_hcl palette

Usage

```
diverge_hcl()
```

diverge_hsv	<i>Diverge_hsv</i>
-------------	--------------------

Description

Data Frame of the diverge_hsv palette

Usage

```
diverge_hsv()
```

get_palette	<i>Get Palette</i>
-------------	--------------------

Description

retrieves one of the available palettes

Usage

```
get_palette(palette, rgb = TRUE)
```

Arguments

palette	one of the available palettes. See colour_palettes
rgb	logical indicating if the palette should be returned as an RGB matrix TRUE, or a vector of hex strings FALSE

Value

3 column matrix if rgb = TRUE, otherwise a 256-length vector.

Examples

```
get_palette( "viridis" )  
get_palette( "rainbow" )
```

gnbu

Gnbu

Description

Data Frame of the gnbu palette

Usage

```
gnbu()
```

green2red
