

# Package ‘spectralAnomaly’

May 9, 2026

**Type** Package

**Title** Detect Anomalies Using the Spectral Residual Algorithm

**Version** 0.1.1

**Description** Apply the spectral residual algorithm to data, such as a time series, to detect anomalies. Anomaly scores can be used to determine outliers based upon a threshold or fed into more sophisticated prediction models. Methods are based upon “Time-Series Anomaly Detection Service at Microsoft”, Ren, H., Xu, B., Wang, Y., et al., (2019) [doi:10.48550/arXiv.1906.03821](https://doi.org/10.48550/arXiv.1906.03821).

**License** MIT + file LICENSE

**Encoding** UTF-8

**Imports** stats, utils

**Suggests** testthat (>= 3.0.0)

**Config/testthat/edition** 3

**RoxygenNote** 7.3.2

<b>Index</b>	<b>4</b>
--------------	----------

---

anomaly_score	<i>Create anomaly score from input data</i>
---------------	---

---

### Description

Convert an input of numeric data, typically a time series, into a score for anomaly detection. The data is first extended to improve the detection latency, followed by saliency map creation. The score is calculated using the sliding window average for each point in the saliency map.

### Usage

```
anomaly_score(x, score_window, spec_window = 3, m = 5)
```

### Arguments

x	Numeric vector.
score_window	Integer value for the window width for scoring.
spec_window	Positive integer value for the window to calculate the averaged log spectrum.
m	Integer value representing the number of preceding points for the estimation.

### Value

A numeric vector of anomaly scores.

### Examples

```
tmp <- ts(rnorm(12*6,10,2), start=c(2009, 1), end=c(2014, 12), frequency=12)
anomaly_score(tmp, score_window = 25)
```

---

anomaly_thresh	<i>Apply threshold to anomaly score</i>
----------------	---

---

### Description

A helper function that wraps around quantile to apply a threshold to anomaly scores.

### Usage

```
anomaly_thresh(x, threshold = 0.99, ...)
```

### Arguments

x	Numeric vector of anomaly scores (e.g. created by anomaly_score).
threshold	Numeric value to determine the threshold to flag outliers among the score.
...	Additional parameters passed to quantile.

**Value**

Logical vector referencing which, if any, of the provided values are outliers.

**Examples**

```
test_data <- c(1,2,3,4,5,100,5,4,3,2,1)
anomaly_thresh(test_data, 0.99)
```

---

saliency_map	<i>Create saliency map</i>
--------------	----------------------------

---

**Description**

Using the provided numeric input, typically a time series, calculate the spectral residual and output the saliency map for use in anomaly detection.

**Usage**

```
saliency_map(x, window = 3)
```

**Arguments**

x	Numeric vector.
window	Positive integer value.

**Value**

Numeric vector representing the saliency map values.
